1 GENERAL DESCRIPTION

The NuMicro® NM1240 series 32-bit microcontrollers are embedded with ARM® Cortex®-M0 core for industrial applications which need high performance, high integration, and low cost. The Cortex®-M0 is the newest ARM® embedded processor with 32-bit performance at a cost equivalent to the traditional 8-bit microcontroller.

The NM1240 series can run up to 48(60) MHz and operate at 2.2V(3.3V) ~ 5.5V, -40℃ ~ 105℃, and thus can support a variety of industrial control applications which need high CPU performance. The NM1240 offers 64 Kbytes embedded program Flash, size configurable Data Flash (shared with program flash), 7.5 Kbytes Flash for the ISP, 1.5 Kbytes SPROM for security, and 8Kbytes SRAM.

Many system level peripheral functions, such as I/O Port, Timer, UART, SPI, I²C, PWM, ADC, OP, Watchdog Timer, Analog Comparator and Brown-out Detector, have been incorporated into the NM1240 to reduce component count, board space and system cost. These useful functions make the NM1240 powerful for a wide range of applications.

Additionally, the NM1240 series is equipped with ISP (In-System Programming) and ICP (In-Circuit Programming) functions, which allow the user to update the program memory without removing the chip from the actual end product.

2 FEATURES

- Core
  - ARM® Cortex®-M0 core running up to 48/60 MHz by internal RC oscillator
  - One 24-bit system timer
  - Supports low power Idle mode
  - A single-cycle 32-bit hardware multiplier
  - NVIC for the 32 interrupt inputs, each with 4-level of priority
  - Supports Serial Wire Debug (SWD) interface and two watch points/four breakpoints
- Built-in LDO for wide operating voltage ranged: 2.2 V to 5.5 V
- Memory
  - 64 Kbytes Flash memory for program memory (APROM)
  - Configurable Flash memory for data memory (Data Flash)
  - 7.5 KB Flash memory for loader (LDROM)
  - Three 0.5 KB Flash memory for security protection (SPROM0, 1, 2)
  - 8 KB SRAM for internal scratch-pad RAM (SRAM)
- Clock Control
  - Programmable system clock source
    - Switch clock sources on-the-fly
  - Up to 24 MHz External Clock input (EXT_CLK)
  - 48(60) MHz internal oscillator (HIRC) (1% accuracy at 25^0C, 5V)
  - 10 kHz internal low-power oscillator (LIRC) for Watchdog Timer and idle wake-up
- I/O Port
  - Up to 44 general-purpose I/O (GPIO) pads and 1 Reset pad
  - Four I/O modes:
    - Quasi-bidirectional input/output
    - Push-Pull output
    - Open-Drain output
    - Input only with high impendence
  - Optional TTL/Schmitt trigger input
  - I/O pin can be configured as interrupt source with edge/level setting
  - Supports high driver and high sink I/O mode
  - GPIO built-in Pull-up/Pull-low resistor for selection.
- Timer
  - Provides three channel 32-bit Timers; one 8-bit pre-scalar counter with 24-bit up-timer for each timer
  - Independent clock source for each timer

- Provides One-shot, Periodic, Toggle and Continuous operation modes
- 24-bit up counter value is readable through TDR (Timer Data Register)
- Provides trigger counting/free counting/counter reset function triggered by external capture pin or internal comparator signal
- Supports event counter function
- Supports Toggle Output mode
- Supports wake-up from Idle or Power-down mode
- Continuous Capture
- Timer0, Timer1, Timer2 and Systick provided with continuous capture function to capture at most 4 edges continuously on one signal

- ECAP (Enhanced Input Capture)
  - One units of 24-bit input capture counter
  - Capture surce:
    - I/O inputs: ECAP ports(ECAP0, ECAP1 and ECAP2)
    - ACMP Trigger
- GDMA (General Direct Memory Access
  - Two channels
  - Memory to/from memory or APB device
  - Memory to/from USCI TX/RX buffer which supports the hardware trigger
  - Supports “4-data burst” mode to boost performance
- WDT (Watchdog Timer)
  - Programmable clock source and time-out period
  - Supports wake-up function in Power-down mode and Idle mode
  - Interrupt or reset selectable on watchdog time-out
- EPWM
  - Supports a built-in 16-bit PWM clock generators, providing SIX PWM outputs or three complementary paired PWM outputs
  - Shared same as clock source, clock divider, period and dead-zone generator
  - Supports group/independent/complementary modes
  - Supports One-shot or Auto-reload mode
  - Supports Edge-aligned and Center-aligned type
  - Supports Asymmetric mode
  - Programmable dead-zone insertion between complementary channels
  - Each output has independent polarity setting control
  - Hardware fault brake and software brake protections
  - Support three of hardware Brake pin
  - Supports rising, falling, central, period, and fault break interrupts

- Supports duty/period trigger A/D conversion
- Timer comparing matching event trigger PWM to do phase change
- Supports comparator event trigger PWM to force PWM output low for current period
- Provides interrupt accumulation function

- BPWM
  - One 16-bit PWM generator which supports one 8-bit pre-scalar, one clock divider, two PWM timers (down counter) and one dead-zone generator
  - Two independent outputs or one complementary paired outputs.
  - PWM Interrupt request synchronized with PWM period
  - Edge-aligned type or Center-aligned type option
  - Synchronous mode for BPWM and EPWM
- USCI (Universal Serial Control Interface Controller)
  - Two USCI devices
  - USCI1 Supports to be configured as UART, SPI or I²C individually
  - USCI2 Supports to be configured as UART and I²C individually
  - Supports programmable baud-rate generator
  - Supports GDMA trasfer
- ADC (Analog-to-Digital Converter)
  - 12-bit ADC with 800ns conversion time
  - Supports 2 S/H (sample/hold)
  - Up to 16-ch single-end input from I/O and one internal input from band-gap.
  - Each input channel has own data register
  - Conversion started either by software trigger, PWM trigger, ACMP trigger or external pin trigger
  - Supports temperature sensor for measurement chip temperature
  - Supports Simultaneous and Sequential continuous conversion.
- OP Amplifier
  - Rail-to-rail OPA x 1
  - Slew rate 6 V/us at least
  - Supports OP1 output as input of ADC and ACMP
- DAC
  - Built-in two 12-bit DAC,
  - Be the reference voltage for ACMP, ADC or output to pins.
- Analog Comparator
  - One analog comparators with 4 reference voltage source
    - Built-in 12-bit DAC0 and DAC1 for comparator reference voltage

- Band-gap voltage
- External voltage from port pin

- Supports Hysteresis function 0/20/90/150mV at V_{DD} = 5V
- Interrupt when compared result changed

- Hardware Divider
  - Signed (two's complement) integer calculation
  - 32-bit dividend with 16-bit divisor calculation capacity
  - 32-bit quotient and 32-bit remainder outputs (16-bit remainder with sign extends to 32-bit)
  - Divided by zero warning flag
  - 6 HCLK clocks taken for one cycle calculation
  - Waiting for calculation ready automatically when reading quotient and remainder
  - Support 3 group of independent dividend, divisor, quotient and remainder registers for three times of calculation capacity
- ISP (In-System Programming) and ICP (In-Circuit Programming)
- BOD (Brown-out Detector)
  - 8 programmable threshold levels: 4.3V/4.0V/3.7V/3.0V/2.7V/2.4V/2.2V/2.0V
  - Supports Brown-out interrupt and reset option
- 96-bit unique ID
- LVR (Low Voltage Reset)
- Operating Temperature: -40℃~105℃
- Reliability: EFT > ± 4KV, ESD HBM pass 8KV
- Packages:
  - 48-pin LQFP(7x7mm), 48-pin QFN(7x7mm), 32-pin QFN(4x4mm)
  - Package is Halogen-free, RoHS-compliant and TSCA-compliant.

3 ABBREVIATIONS

3.1 Abbreviations

Acronym	Description
ACMP	Analog Comparator Controller
ADC	Analog-to-Digital Converter
AHB	Advanced High-Performance Bus
APB	Advanced Peripheral Bus
BOD	Brown-out Detection
DAC	Digital -to-Analog Converter
DAP	Debug Access Port
EPWM	Enhanced Pulse Width Modulation
FIFO	First In, First Out
FMC	Flash Memory Controller
GPIO	General-Purpose Input/Output
HCLK	The Clock of Advanced High-Performance Bus
HIRC	48 MHz Internal High Speed RC Oscillator
EXT_CLK	External Clock Input
ICP	In Circuit Programming
ISP	In System Programming
ISR	Interrupt Service Routine
LDO	Low Dropout Regulator
LIRC	10 kHz internal low speed RC oscillator (LIRC)
NVIC	Nested Vectored Interrupt Controller
PCLK	The Clock of Advanced Peripheral Bus
PWM	Pulse Width Modulation
GDMA	Gerneal direct memory access
SPI	Serial Peripheral Interface
SPS	Samples per Second
TMR	Timer Controller
UART	Universal Asynchronous Receiver/Transmitter
UCID	Unique Customer ID
WDT	Watchdog Timer

4.3.2 NM1240 Series Pin Description

MFP* = Multi-function pin. (Refer to section SYS_GPx_MFP)

PA.0 MFP0 means SYS_GPA_MFP[3:0]=0x0.

PA.4 MFP5 means SYS_GPA_MFP[19:16]=0x5.

MFP only configures the ouput data or input data of PAD, the direction of PAD were configured by PMD.

The priority of MFP in the same multi-function was GPA > GPB > GPC > GPD > GPE > GPF.

The type A of multi-function needs to be configured to be input port.

4.3.2.1 NM1240 Series LQFP48/QFN48/QFN33 Pin Description

QFN33	QFN48/ LQFP48	Pin Name	Type	MFP*	Description
-	1	LDO_CAP/ NC(LQFP48)	A/	MFP0/	LDO output pin. Note: Recommend to connect a 1uF CAP to the pin.
-	2	PE.7	I/O	MFP0	General purpose digital I/O pin.
		I2C2_SCL	I/O	MFP8	I2C2 clock pin.
		SPI1_MOSI	I/O	MFPA	SPI1 MOSI (Master Out, Slave In) pin.
		UART2_TXD	I/O	MFPB	Data transmitter output pin for UART.
-	3	PD.2	I/O	MFP0	General purpose digital I/O pin.
		ADC1_P1	A	MFP2	ADC1 channel analog input.
		CCAP_P0	I	MFP7	Timer Continuous Capture input pin.
		SPI1_MISO	I/O	MFPA	SPI1 MISO (Master In, Slave Out) pin.
-	4	PF.0	I/O	MFP0	General purpose digital I/O pin.
		I2C2_SDA	I/O	MFP8	I2C2 data input/output pin.
		SPI1_SS	I/O	MFPA	SPI1 slave select pin.
		UART2_RXD	I/O	MFPB	Data receiver input pin for UART.
		ECAP0	I	MFPC	Enhanced Input Capture input pin.
2	5	PF.1	I/O	MFP0	General purpose digital I/O pin.
		EPWM_CH3	O	MFP3	EPWM channel3 output/capture input.
		I2C2_SCL	I/O	MFP8	I2C2 clock pin.
		UART2_TXD	I/O	MFPB	Data transmitter output pin for UART.
		ECAP1	I	MFPC	Enhanced Input Capture input pin.
3	6	PF.2	I/O	MFP0	General purpose digital I/O pin.
		ADC0_P8	A	MFP2	ADC0 channel analog input.
		EPWM_CH2	O	MFP3	EPWM channel2 output/capture input.

QFN33	QFN48/ LQFP48	Pin Name	Type	MFP*	Description
		I2C2_SDA	I/O	MFP8	I2C2 data input/output pin.
		UART2_RXD	I/O	MFPB	Data receiver input pin for UART.
		ECAP2	I	MFPC	Enhanced Input Capture input pin.
4	7	nRESET	I	MFP0	External reset input: active LOW, with an internal pull-up. Set this pin low reset to initial state.
-	8	PF.3	I/O	MFP0	General purpose digital I/O pin.
		ADC1_P3	A	MFP2	ADC1 channel analog input.
		EPWM_CH1	O	MFP3	EPWM channel1 output/capture input.
5	9	PF.4	I/O	MFP0	General purpose digital I/O pin.
		ADC1_P4	A	MFP2	ADC1 channel analog input.
		EPWM_CH0	O	MFP3	EPWM channel0 output/capture input.
6	10	PB.0	I/O	MFP0	General purpose digital I/O pin.
		ADC0_P0	A	MFP2	ADC0 channel analog input.
		ACMP0_P0	A	MFP4	Analog comparator0 positive input pin.
		ECAP0	I	MFP7	Enhanced Input Capture input pin.
		UART1_TXD	O	MFPB	Data transmitter output pin for UART.
		ECAP0	I	MFPC	Enhanced Input Capture input pin.
7	11	PB.1	I/O	MFP0	General purpose digital I/O pin.
		ADC0_P1	A	MFP2	ADC0 channel analog input.
		ACMP0_P1	A	MFP4	Analog comparator0 positive input pin.
		ECAP1	I	MFP7	Enhanced Input Capture input pin.
		UART1_RXD	I	MFPB	Data receiver input pin for UART.
		ECAP1	I	MFPC	Enhanced Input Capture input pin.
8	12	PB.2	I/O	MFP0	General purpose digital I/O pin.
		ADC0_P2	A	MFP2	ADC0 channel analog input.
		BPWM_CH1	O	MFP3	BPWM channel1 output/capture input.
		ACMP0_P2	A	MFP4	Analog comparator0 positive input pin.
		ECAP2	I	MFP7	Enhanced Input Capture input pin.
		UART1_TXD	O	MFPB	Data transmitter output pin for UART.
		ECAP2	I	MFPC	Enhanced Input Capture input pin.
		T2	I/O	MFPE	Timer2 event counter input / toggle output.
9	13	PB.3	I/O	MFP0	General purpose digital I/O pin.

QFN33	QFN48/ LQFP48	Pin Name	Type	MFP*	Description
		ADC0_P9	A	MFP2	ADC0 channel analog input.
		T0	I/O	MFP7	Timer0 event counter input / toggle output.
		UART1_RXD	I	MFPB	Data receiver input pin for UART.
10	14	PB.4	I/O	MFP0	General purpose digital I/O pin.
		ADC1_P0	A	MFP2	ADC1 channel analog input.
		ACMP0_N	A	MFP4	Analog comparator0 negative input pin.
		T1	I/O	MFP7	Timer1 event counter input / toggle output.
		SPI1_SS	I/O	MFPA	SPI1 slave select pin.
		UART2_TXD	I/O	MFPB	Data transmitter output pin for UART.
11	15	PB.5	I/O	MFP0	General purpose digital I/O pin.
		ADC0_P5	A	MFP2	ADC0 channel analog input.
		DAC0	A	MFP4	DAC0 analog output.
		CCAP_P0	I	MFP7	Timer Continuous Capture input pin.
		SPI1_CLK	I/O	MFPA	SPI1 serial clock pin.
		UART2_RXD	I/O	MFPB	Data receiver input pin for UART.
12	16	PB.6	I/O	MFP0	General purpose digital I/O pin.
		ADC0_P6	A	MFP2	ADC0 channel analog input.
		PWM_BRK_P1	I	MFP3	Brake input pin of EPWM.
		CCAP_P0	I	MFP7	Timer Continuous Capture input pin.
		SPI1_MISO	I/O	MFPA	SPI1 MISO (Master In, Slave Out) pin.
		ECAP1	I	MFPC	Enhanced Input Capture input pin.
		T1	I/O	MFPE	Timer1 event counter input / toggle output.
13	17	PB.7	I/O	MFP0	General purpose digital I/O pin.
		ADC0_P7	A	MFP2	ADC0 channel analog input.
		PWM_BRK_P2	I	MFP3	Brake input pin of EPWM.
		CCAP_P0	I	MFP7	Timer Continuous Capture input pin.
		SPI1_MOSI	I/O	MFPA	SPI1 MOSI (Master Out, Slave In) pin.
		ECAP0	I	MFPC	Enhanced Input Capture input pin.
		EPWM_CH0	O	MFPE	EPWM channel0 output/capture input.
		EPWM_CH1	O	MFPF	EPWM channel1 output/capture input.
14	18	PC.5	I/O	MFP0	General purpose digital I/O pin.

QFN33	QFN48/ LQFP48	Pin Name	Type	MFP*	Description
		ADC1_P5	A	MFP2	ADC1 channel analog input.
		PWM_BRK_P0	I	MFP3	Brake input pin of EPWM.
		CCAP_P1	I	MFP7	Timer Continuous Capture input pin.
		ECAP2	I	MFPC	Enhanced Input Capture input pin.
		EPWM_CH1	O	MFPE	EPWM channel1 output/capture input.
		EPWM_CH3	O	MFPF	EPWM channel3 output/capture input.
15	19	PC.6	I/O	MFP0	General purpose digital I/O pin.
		ADC1_P6	A	MFP2	ADC1 channel analog input.
		EPWM_CH2	O	MFP3	EPWM channel2 output/capture input.
		DAC1	O	MFP5	DAC1 analog output.
		T2	I/O	MFP7	Timer2 event counter input / toggle output.
		I2C2_SCL	I/O	MFP8	I2C2 clock pin.
		UART2_TXD	I/O	MFPB	Data transmitter output pin for UART.
		EPWM_CH5	O	MFPF	EPWM channel5 output/capture input.
-	20	PC.7	I/O	MFP0	General purpose digital I/O pin.
		ADC1_P7	A	MFP2	ADC1 channel analog input.
		ECAP1	I	MFPC	Enhanced Input Capture input pin.
-	21	PC.0	I/O	MFP0	General purpose digital I/O pin.
		ADC0_P3	A	MFP2	ADC0 channel analog input.
		BPWM_CH0	O	MFP3	BPWM channel0 output/capture input.
		I2C1_SCL	I/O	MFP8	I2C1 clock pin.
		SPI1_CLK	I/O	MFPA	SPI1 serial clock pin.
		UART1_TXD	O	MFPB	Data transmitter output pin for UART.
-	22	PC.1	I/O	MFP0	General purpose digital I/O pin.
		ADC0_P4	A	MFP2	ADC0 channel analog input.
		STADC	I	MFP3	ADC external trigger input.
		ACMP0_P3	A	MFP4	Analog comparator0 positive input pin.
		CCAP_P1	I	MFP7	Timer Continuous Capture input pin.
		I2C1_SDA	I/O	MFP8	I2C1 data input/output pin.
		SPI1_MISO	I/O	MFPA	SPI1 MISO (Master In, Slave Out) pin.
		UART1_RXD	I	MFPB	Data receiver input pin for UART.

QFN33	QFN48/ LQFP48	Pin Name	Type	MFP*	Description
16	23	PC.2	I/O	MFP0	General purpose digital I/O pin.
		ADC1_P2	A	MFP2	ADC1 channel analog input.
		PWM_BRK_P0	I	MFP3	Brake input pin of EPWM.
		CCAP_P1	I	MFP7	Timer Continuous Capture input pin.
		I2C1_SDA	I/O	MFP8	I2C1 data input/output pin.
		SPI1_MOSI	I/O	MFPA	SPI1 MOSI (Master Out, Slave In) pin.
		UART1_RXD	I	MFPB	Data receiver input pin for UART.
17	24	PC.3	I/O	MFP0	General purpose digital I/O pin.
		EXT_CLK	I	MFP1	External oscillator input pin.

		I2C2_SDA	I/O	MFP8	I2C2 data input/output pin.
		UART2_RXD	I	MFPB	Data receiver input pin for UART.
31	44	PE.4	I/O	MFP0	General purpose digital I/O pin.
		ADC1_P9	A	MFP2	ADC1 channel analog input.
		OP1_P	A	MFP6	Operational Amplifier Positive input pin.
-	45	PE.5	I/O	MFP0	General purpose digital I/O pin.
		BPWM_CH0	O	MFP3	BPWM channel0 output/capture input.
		I2C1_SCL	I/O	MFP8	I2C1 clock pin.
		SPI1_CLK	I/O	MFPA	SPI1 serial clock pin.
		UART1_TXD	O	MFPB	Data transmitter output pin for UART.
-	46	PE.6	I/O	MFP0	General purpose digital I/O pin.
		T0	I/O	MFP7	Timer0 event counter input / toggle output.
		I2C1_SDA	I/O	MFP8	I2C1 data input/output pin.

QFN33	QFN48/ LQFP48	Pin Name	Type	MFP*	Description
		SPI1_MISO	I/O	MFPA	SPI1 MISO (Master In, Slave Out) pin.
		UART1_RXD	I	MFPB	Data receiver input pin for UART.
32	47	VSS	PWR	MFP0	Ground pin for digital circuit.
1	48	VDD	PWR	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital function.

Table 4.3-1 LQFP48/QFN48/QFN33 Pin Description

Note:

1. Do not leave the pins ICE_CLK and ICE_DAT in floating when MCU is in operatoin. User may refer to one of the following methods
    a. Add external pull-up or pull-low resistors at pins.
    b. Set the 2 pins in Quasi-mode and output high to be equivelant to internal pull high.
    c. Enable intenal pull-up by setting PD_PHEN[1] = 1b、PD_PHEN[5] = 1b.
    d. Be wired to other deivce without floating at pins.

4.3.3 GPIO Multi-function Pin Summary

MFP* = Multi-function pin. (Refer to section SYS_GPx_MFP)

PA.0 MFP0 means SYS_GPA_MFP[3:0]=0x0.

PA.4 MFP5 means SYS_GPA_MFP[19:16]=0x5.

Group	Pin Name	GPIO	MFP*	Type	Description
ACMP0	ACMP0_P0	PB.0	MFP4	A	Comparator0 positive input pin.
	ACMP0_P1	PB.1	MFP4	A	Comparator0 positive input pin.
	ACMP0_P2	PB.2	MFP4	A	Comparator0 positive input pin.
	ACMP0_P3	PC.1	MFP4	A	Comparator0 positive input pin.

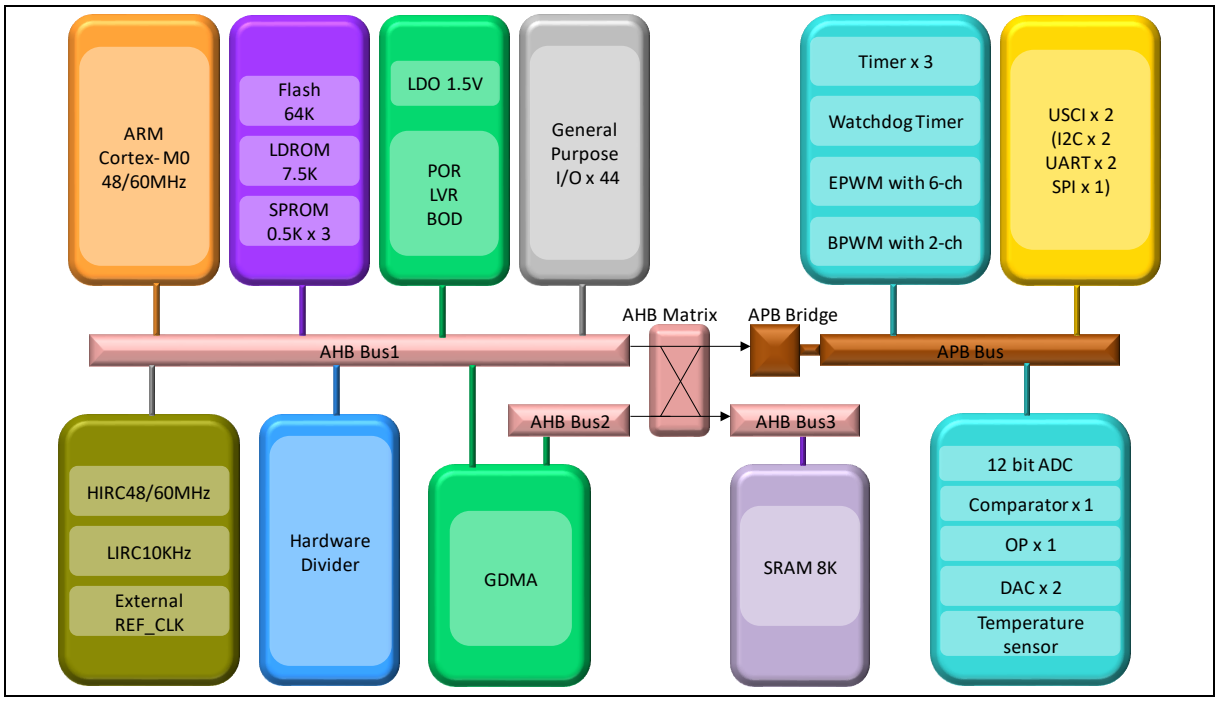

Figure 5.1-1 NuMicro® NM1240 Block Diagram

6 FUNCTIONAL DESCRIPTION

6.1 ARM® Cortex®-M0 Core

6.1.1 Overview

The Cortex®-M0 processor is a configurable, multistage, 32-bit RISC processor, which has an AMBA AHB-Lite interface and includes an NVIC component. It also has optional hardware debug functionality. The processor can execute Thumb code and is compatible with other Cortex®-M profile processor. The profile supports two modes – Thread mode and Handler mode. Handler mode is entered as a result of an exception. An exception return can only be issued in Handler mode. Thread mode is entered on Reset, and can be entered as a result of an exception return. Figure 6.1-1 shows the functional controller of processor.

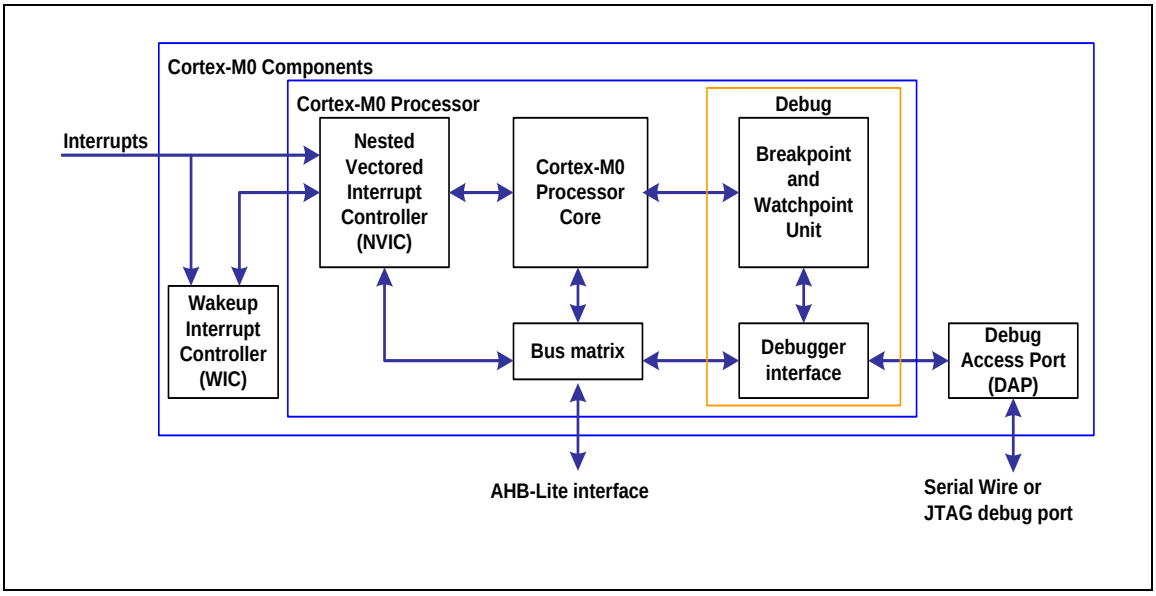

Figure 6.1-1 Functional Block Diagram

6.1.2 Features

The implemented device provides:

- A low gate count processor:
  - ARMv6-M Thumb® instruction set
  - Thumb-2 technology
  - ARMv6-M compliant 24-bit SysTick timer
  - A 32-bit hardware multiplier
  - System interface supported with little-endian data accesses
  - Ability to have deterministic, fixed-latency, interrupt handling
  - Load/store-multiples and multicycle-multiplies that can be abandoned and restarted to facilitate rapid interrupt handling

- C Application Binary Interface compliant exception model. This is the ARMv6-M, C Application Binary Interface (C-ABI) compliant exception model that enables the use of pure C functions as interrupt handlers
- Low Power Sleep mode entry using the Wait For Interrupt (WFI), Wait For Event (WFE) instructions, or return from interrupt sleep-on-exit feature

- NVIC:
  - 32 external interrupt inputs, each with four levels of priority
  - Dedicated Non-maskable Interrupt (NMI) input
  - Supports for both level-sensitive and pulse-sensitive interrupt lines
  - Supports Wake-up Interrupt Controller (WIC) and, providing Ultra-low Power Sleep mode
- Debug support:
  - Four hardware breakpoints
  - Two watchpoints
  - Program Counter Sampling Register (PCSR) for non-intrusive code profiling
  - Single step and vector catch capabilities
- Bus interfaces:
  - Single 32-bit AMBA-3 AHB-Lite system interface that provides simple integration to all system peripherals and memory
  - Single 32-bit slave port that supports the DAP (Debug Access Port)

6.2 System Manager

6.2.1 Overview

System management includes the following sections:

- System Reset
- System Power Architecture
- System Memory Map
- System management registers for Part Number ID, chip reset and on-chip controllers reset, and multi-functional pin control
- System Timer (SysTick)
- Nested Vectored Interrupt Controller (NVIC)
- System Control registers

6.2.2 System Reset

The system reset can be issued by one of the events listed below. These reset event flags can be read from SYS_RSTSTS register to determine the reset source. Hardware reset can reset chip through peripheral reset signals. Software reset can trigger reset through control registers.

- Hardware Reset Sources
  - Power-on Reset (POR)
  - Low level on the nRESET pin
  - Watchdog Timer Time-out Reset (WDT)
  - Low Voltage Reset (LVR)
  - Brown-out Detector Reset (BOD Reset)
- Software Reset Sources
  - CHIP Reset will reset whole chip by writing 1 to CHIPRST (SYS_IPRST0[0])
  - MCU Reset to reboot but keeping the booting setting from APROM or LDROM by writing 1 to SYSRESETREQ (SCS_AIRCR[2], Application Interrupt and Reset Control Register, address = 0xE000ED0C) in system control registers of Cortex®-M0 core.
  - CPU Reset for Cortex®-M0 core Only by writing 1 to CPURST (SYS_IPRST0[1])

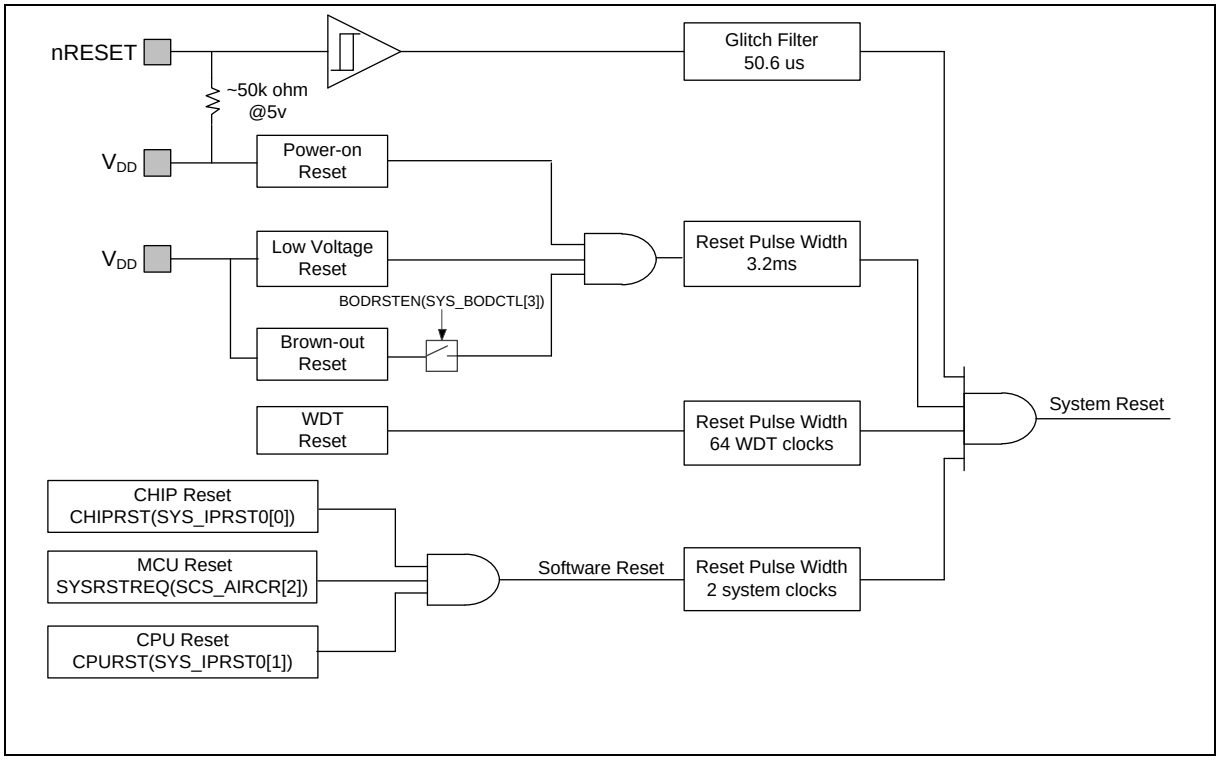

Figure 6.2-1 System Reset Resources

There are a total of 8 reset sources in the NuMicro® family. In general, CPU reset is used to reset Cortex®-M0 only; the other reset sources will reset Cortex®-M0 and all peripherals. However, there are small differences between each reset source and they are listed in Table 6.2-1.

Reset Sources / Register	POR	NRESET	WDT	LVR	BOD	CHIP	MCU	CPU
SYS_RSTSTS	Bit 0 = 1	Bit 1 = 1	Bit 2 = 1	Bit 3 = 1	Bit 4 = 1	Bit 0 = 1	Bit 5 = 1	Bit 7 = 1
CHIPRST (SYS_IPRST0[0])	0x0	-	-	-	-	-	-	-

Other Peripheral Registers	Reset Value							
FMC Registers	Reset Value							

- **Note:** '-' means that the value of register keeps original setting.

Table 6.2-1 Reset Value of Registers

6.2.2.1 nRESET Reset

The nRESET reset means to generate a reset signal by pulling low nRESET pin, which is an asynchronous reset input pin and can be used to reset system at any time. When the nRESET voltage is lower than 0.2 V_{DD} and the state keeps longer than 50.6 us (glitch filter), chip will be reset. The nRESET reset will control the chip in reset state until the nRESET voltage rises above

0.7 V_{DD} and the state keeps longer than 50.6 us (glitch filter). The PINRF (SYS_RSTSTS[1]) will be set to 1 if the previous reset source is nRESET reset. Figure 6.2-2 shows the nRESET reset waveform.

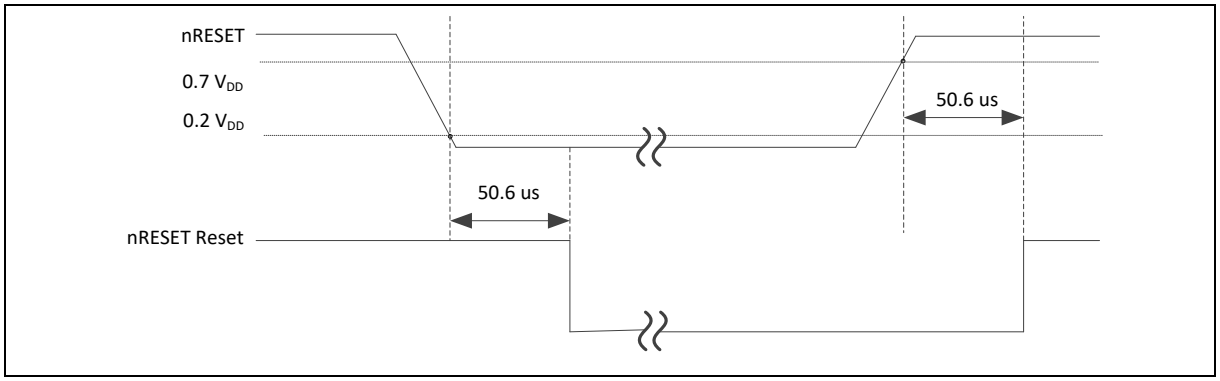

Figure 6.2-2 nRESET Reset Waveform

6.2.2.2 Power-On Reset (POR)

The Power-on reset (POR) is used to generate a stable system reset signal and forces the system to be reset when power-on to avoid unexpected behavior of MCU. When applying the power to MCU, the POR module will detect the rising voltage and generate reset signal to system until the voltage is ready for MCU operation. At POR reset, the PORF (SYS_RSTSTS[0]) will be set to 1 to indicate there is a POR reset event. The PORF (SYS_RSTSTS[0]) bit can be cleared by writing 1 to it. Figure 6.2-3 shows the waveform of Power-On reset.

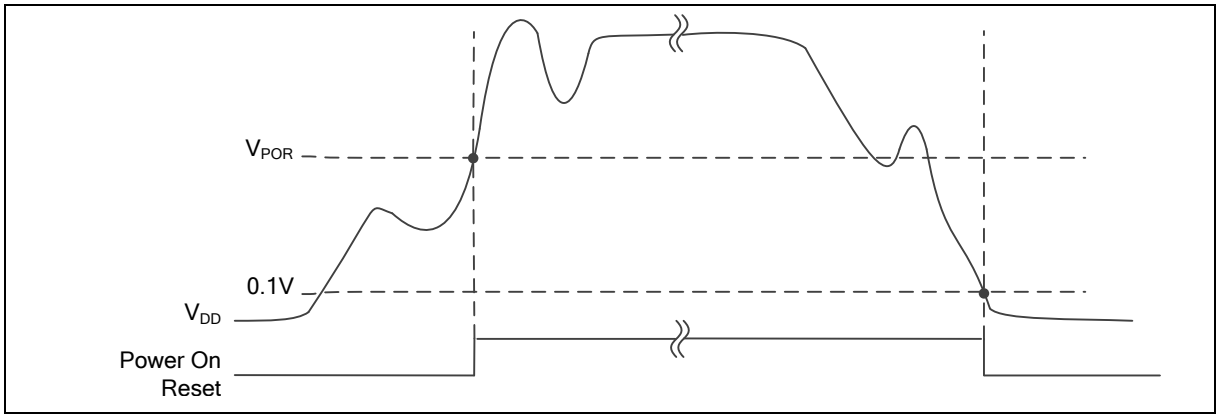

Figure 6.2-3 Power-on Reset (POR) Waveform

6.2.2.3 Low Voltage Reset (LVR)

Low Voltage Reset detects V_{DD} during system operation. When the V_{DD} voltage is lower than V_{LVR} and the state keeps longer than De-glitch time (about 16*HCLK cycles), chip will be reset. The LVR reset will control the chip in reset state until the V_{DD} voltage rises above V_{LVR} and the state keeps longer than De-glitch time. The LVRF (SYS_RSTSTS[3]) will be set to 1 if the previous reset source

is LVR reset. Figure 6.2-4 shows the Low Voltage Reset waveform.

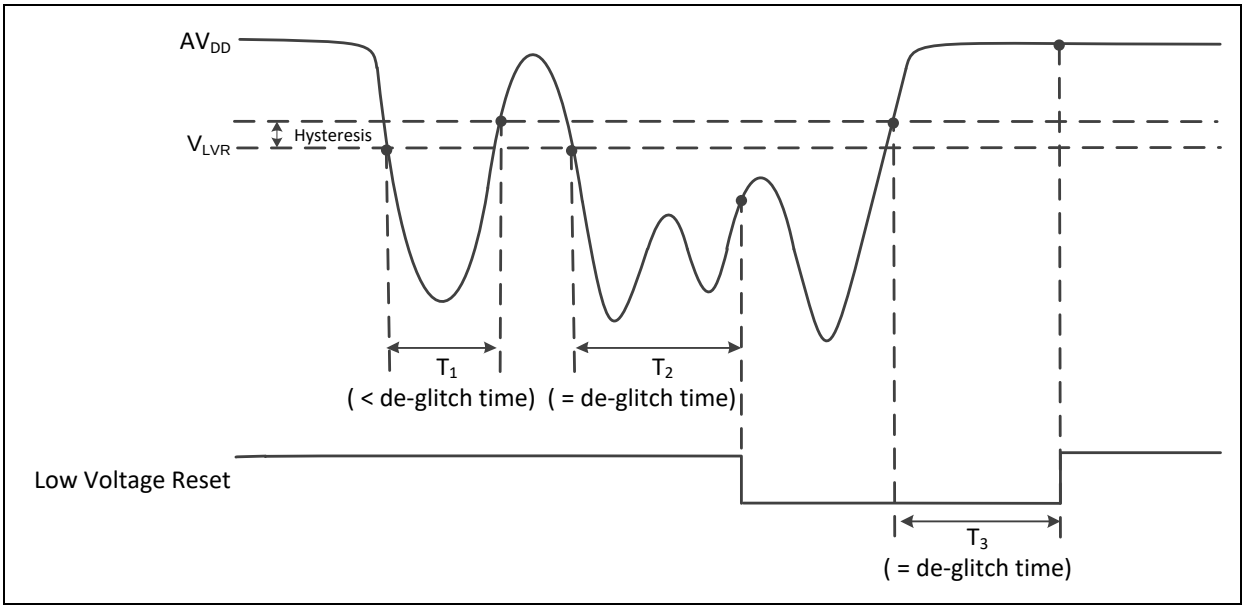

Figure 6.2-4 Low Voltage Reset (LVR) Waveform

6.2.2.4 Brown-out Detector Reset (BOD Reset)

If the Brown-out Detector (BOD) function is enabled by setting the Brown-out Detector Enable Bit BODEN (SYS_BODCTL[0]), Brown-Out Detector function will detect V_{DD} during system operation. When the V_{DD} voltage is lower than V_{BOD} which is decided by BODEN (SYS_BODCTL[0]) and BODVL (SYS_BODCTL[2:1]) and the state keeps longer than De-glitch time (Max(20*HCLK cycles, 1*LIRC cycle)), chip will be reset. The BOD reset will control the chip in reset state until the V_{DD} voltage rises above V_{BOD} and the state keeps longer than De-glitch time. The default value of BODEN, BODVL and BODRSTEN is set by Flash controller user configuration register CBODEN (CONFIG0[11]), CBOV (CONFIG0[15:13]) and CBORST (CONFIG0[12]) respectively. User can determine the initial BOD setting by setting the CONFIG0 register. Figure 6.2-5 shows the Brown-Out Detector waveform.

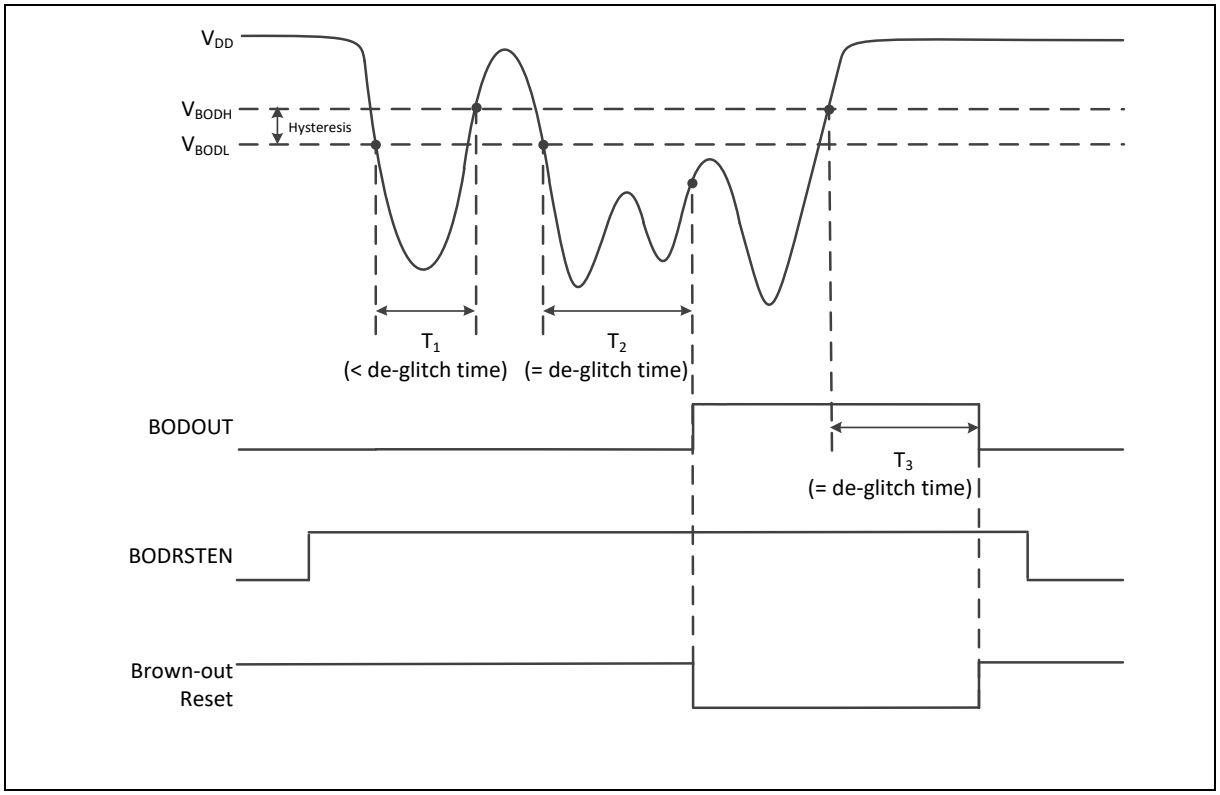

Figure 6.2-5 Brown-out Detector (BOD) Waveform

6.2.2.5 Watchdog Timer Reset

In most industrial applications, system reliability is very important. To automatically recover the MCU from failure status is one way to improve system reliability. The watchdog timer (WDT) is widely used to check if the system works fine. If the MCU is crashed or out of control, it may cause the watchdog time-out. User may decide to enable system reset during watchdog time-out to recover the system and take action for the system crash/out-of-control after reset.

Software can check if the reset is caused by watchdog time-out to indicate the previous reset is a watchdog reset and handle the failure of MCU after watchdog time-out reset by checking WDTRF (SYS_RSTSTS[2]).

6.2.2.6 CPU Reset, CHIP Reset and SYSTEM Reset

The CPU Reset means only Cortex®-M0 core is reset and all other peripherals remain the same status after CPU reset. User can set the CPURST (SYS_IPRST0[1]) to 1 to assert the CPU Reset signal.

The CHIP Reset is same with Power-On Reset. The CPU and all peripherals are reset and BS (FMC_ISPCTL[1]) bit is automatically reloaded from CONFIG setting. User can set the CHIPRST (SYS_IPRST0[0]) to 1 to assert the CHIP Reset signal.

The MCU Reset is similar with CHIP Reset. The difference is that BS (FMC_ISPCTL[1]) will not be reloaded from CONFIG setting and keep its original software setting for booting from APROM or LDROM. User can set the SYSRESETREQ (SCS_AIRCR[2]) to 1 to assert the MCU Reset.

6.2.3 Power Modes and Wake-up Sources

There are several wake-up sources in Idle mode and Power-down mode. Table 6.2-2 lists the available clocks for each power mode.

Power Mode	Normal Mode	Idle Mode	Power-Down Mode
Definition	CPU is in active state	CPU is in sleep state	CPU is in sleep state and all clocks stop except LIRC. SRAM content retained.
Entry Condition	Chip is in normal mode after system reset released	CPU executes WFI instruction.	CPU sets sleep mode enable and power down enable and executes WFI instruction.
Wake-up Sources	N/A	All interrupts	WDT, I²C, Timer, UART, SPI, ACMP, BOD and GPIO
Available Clocks	All	All except CPU clock	LIRC
After Wake-up	N/A	CPU back to normal mode	CPU back to normal mode

Table 6.2-2 Power Mode Difference Table

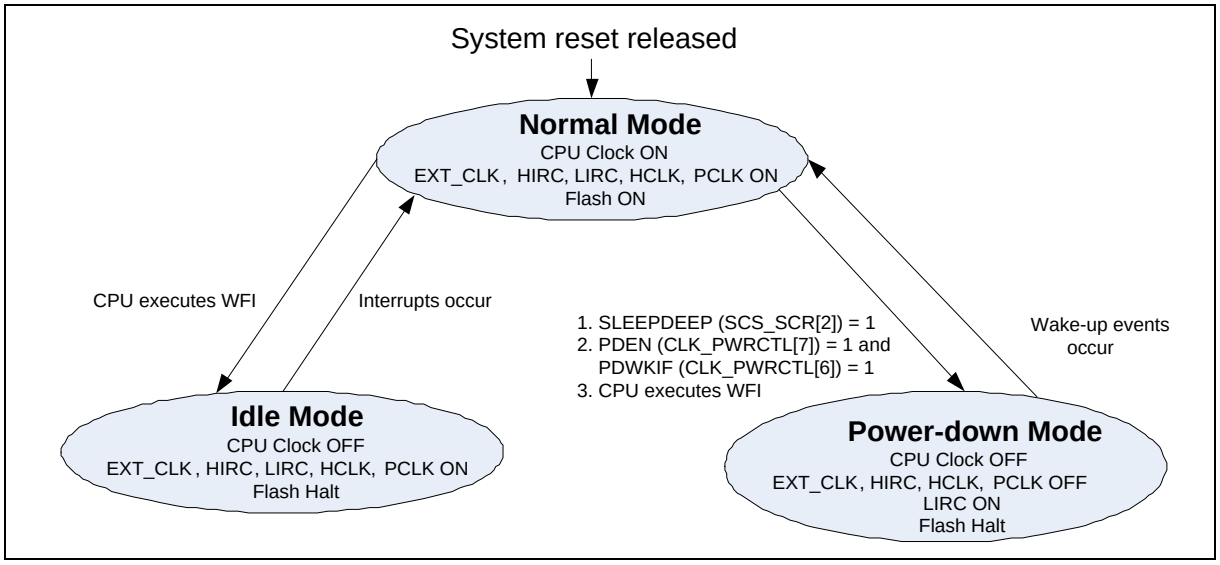

Figure 6.2-6 Power Mode State Machine

1. EXT_CLK ON or OFF depends on SW setting in run mode.
2. LIRC (10 kHz OSC) ON or OFF depends on S/W setting in run mode.
3. If TIMER clock source is selected as LIRCEXT_CLK and LIRCEXT_CLK is on.
4. If WDT clock source is selected as LIRC and LIRC is on.

	Normal Mode	Idle Mode	Power-Down Mode
EXT_CLK (~24 MHz)	ON	ON	Halt
HIRC (48/60) MHz OSC)	ON	ON	Halt
LIRC (10 kHz OSC)	ON	ON	ON/OFF[2]
LDO	ON	ON	ON
CPU	ON	Halt	Halt
HCLK/PCLK	ON	ON	Halt
SRAM retention	ON	ON	ON
FLASH	ON	ON	Halt
GPIO	ON	ON	Halt
TIMER	ON	ON	ON/OFF[3]
BPWM	ON	ON	Halt
EPWM	ON	ON	Halt
WDT	ON	ON	ON/OFF[4]
USCI	ON	ON	Halt
ADC	ON	ON	Halt
ACMP	ON	ON	Halt
ECAP	ON	ON	Halt
HDIV	ON	ON	Halt
OP	ON	ON	Halt

Table 6.2-3 Clocks in Power Modes

Wake-up sources in Power-down mode:

WDT, I²C, Timer, UART, SPI, BOD, ACMP and GPIO

After chip enters power down, the following wake-up sources can wake chip up to normal mode. Table 6.2-4 lists the condition about how to enter Power-down mode again for each peripheral.

*User needs to wait this condition before setting PDEN (CLK_PWRCTL[7]) and execute WFI to enter Power-down mode.

Wake-Up Source	Wake-Up Condition	System Can Enter Power-Down Mode Again Condition*
BOD	Brown-Out Detector Interrupt	After software writes 1 to clear SYS_BODCTL[BODIF].
GPIO	GPIO Interrupt	After software write 1 to clear the Px_INTSRC[n] bit.
TIMER	Timer Interrupt	After software writes 1 to clear TWKF (TIMERx_INTSTS[1]) and TIF (TIMERx_INTSTS[0]).

WDT	WDT Interrupt	After software writes 1 to clear WKF (WDT_CTL[5]) (Write Protect).
USCI UART	Incoming data wake-up	After software writes 1 to clear WKF (UUART_WKSTS[0]).
USCI SPI	SS transaction wake-up	After software writes 1 to clear WKF (USPI_WKSTS[0]).
USCI I^2C	Data toggle	After software writes 1 to clear WKF (UI2C_WKSTS[0]).
	Address match	After software writes 1 to clear WKAKDONE (UI2C_PROTSTS[16], then writes 1 to clear WKF (UI2C_WKSTS[0]).
ACMP	Comparator Power-down Wake-Up Interrupt	After software writes 1 to clear ACMPF0 (ACMP_STATUS[0]) and ACMPF1 (ACMP_STATUS[1]).

Table 6.2-4 Condition of Entering Power-down Mode Again

6.2.4 System Power Architecture

In this chip, the power distribution is divided into three segments.

- Analog power from V_{DD} and V_{SS} provides the power for analog components operation.
- Digital power from V_{DD} and V_{SS} supplies power to the I/O pins and internal regulator which provides a fixed 1.5V power for digital operation.
- A built-in capacitor for internal voltage regulator

The output of internal voltage regulator, LDO, does not require an external capacitor and doesn't bond out to external pin. Figure 6.2-7 shows the power distribution of the NM1240 series.

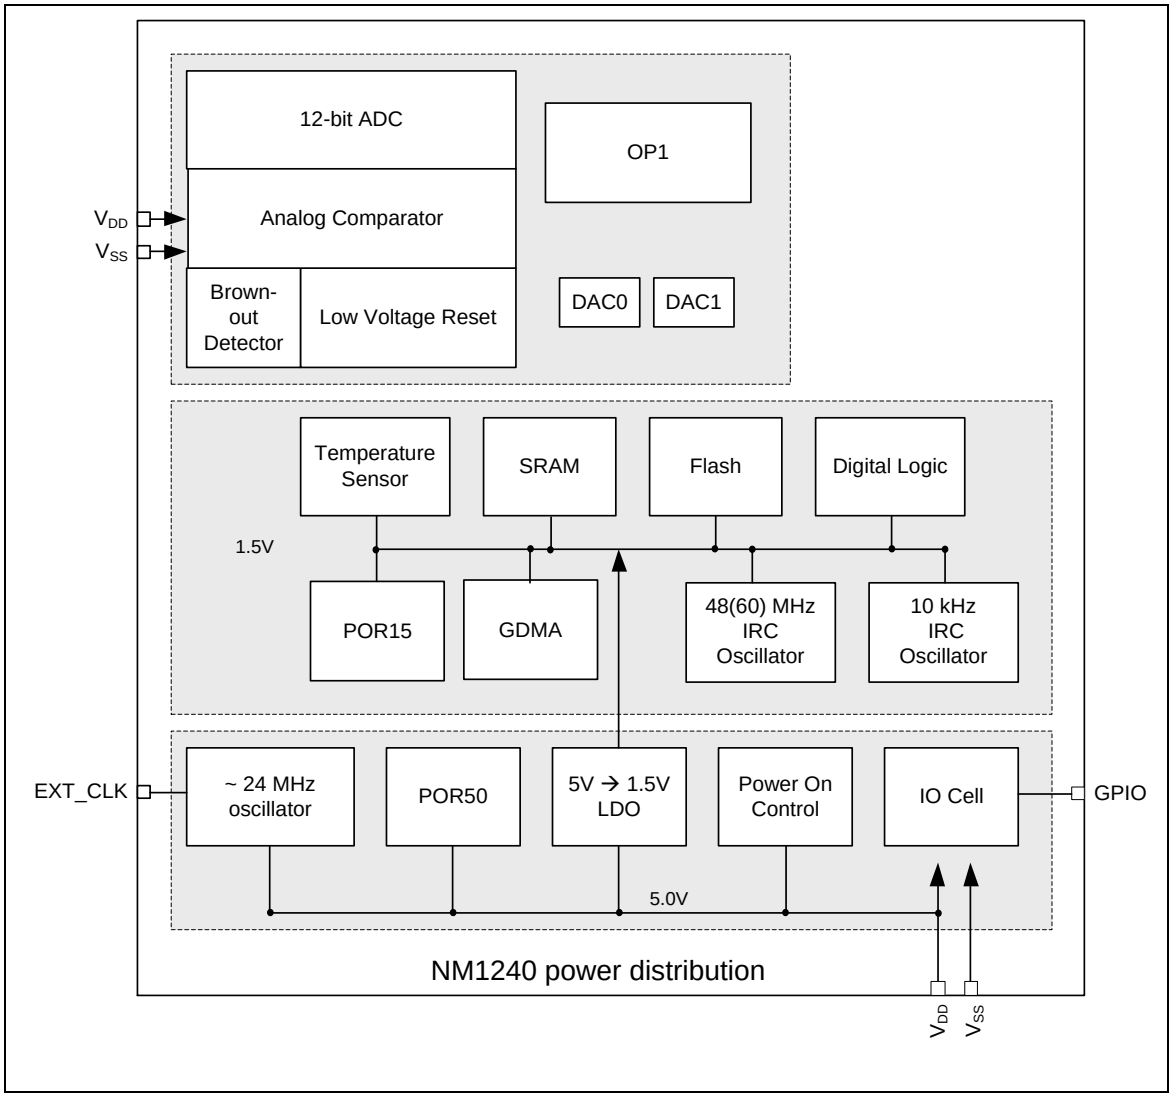

Figure 6.2-7 NuMicro® NM1240 Series Power Architecture Diagram

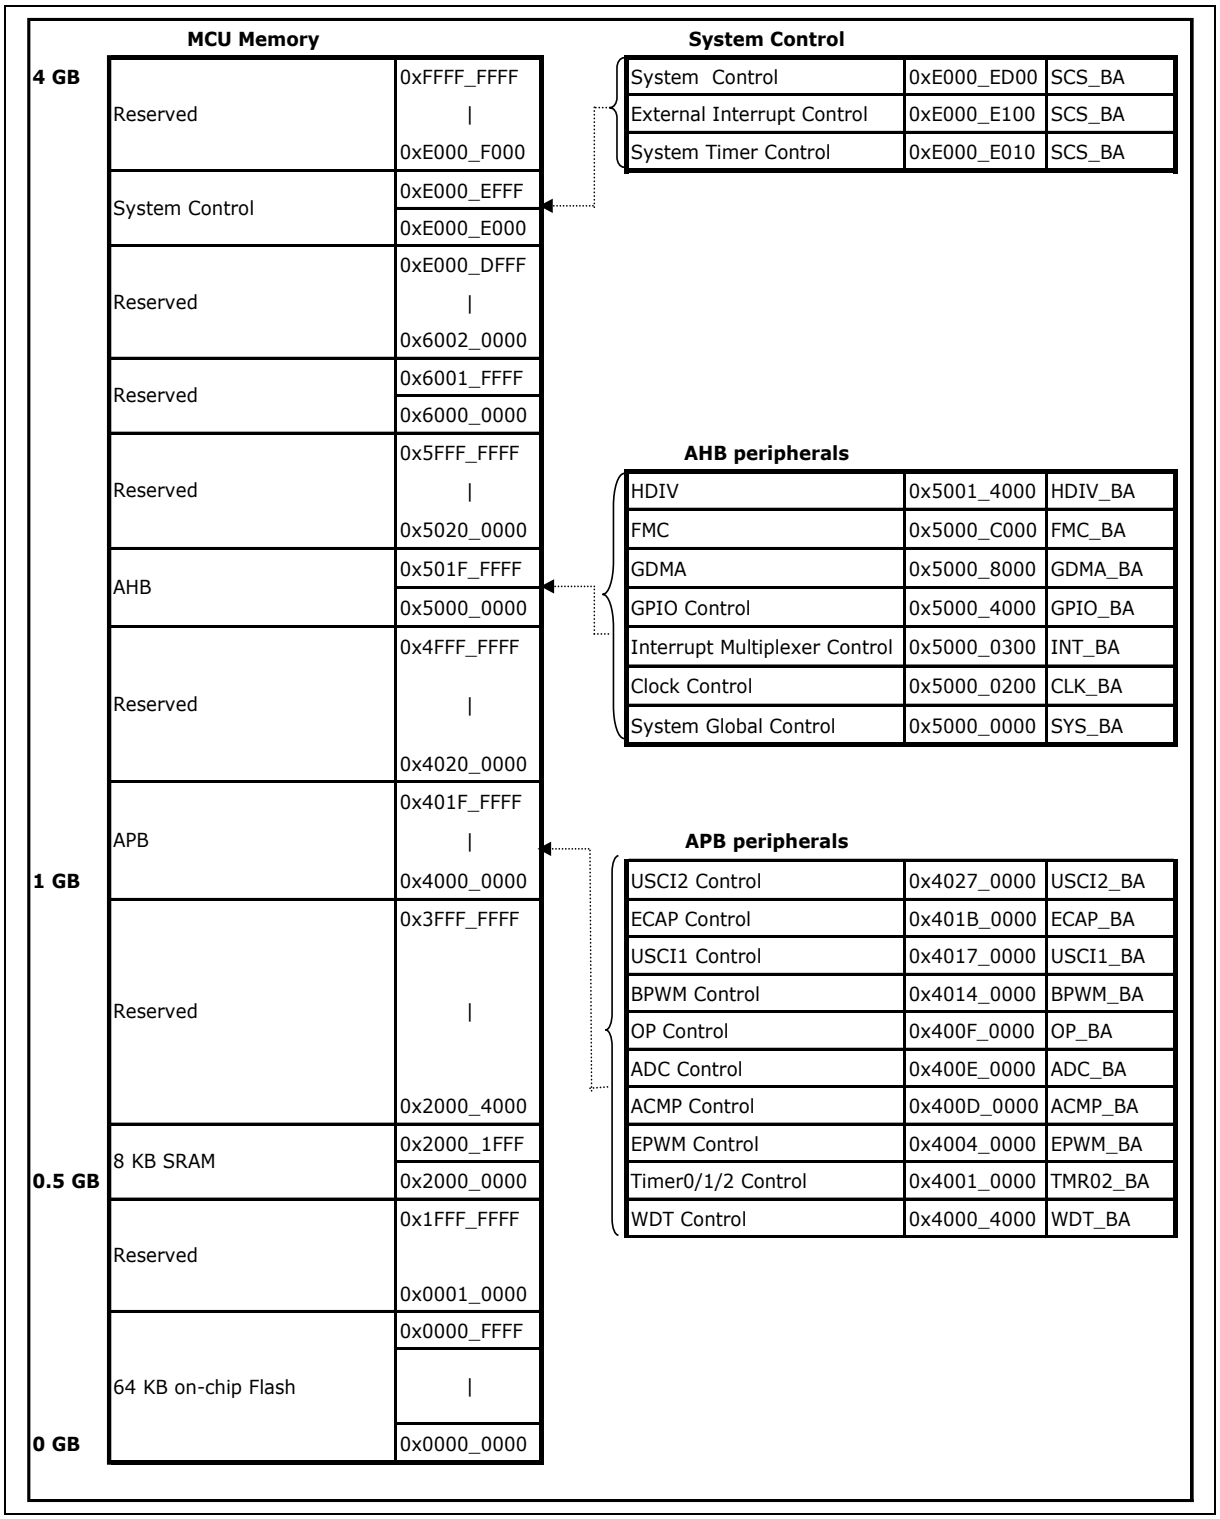
6.2.5 System Memory Mapping



Tale 6.2-5 Memory Mapping Table

6.2.6 Register Protection

Some of the system control registers need to be protected to avoid inadvertent write and disturb the chip operation. These system control registers are protected after the power on reset till user to disable register protection. For user to program these protected registers, a register protection disable sequence needs to be followed by a special programming. The register protection disable sequence is writing the data “59h”, “16h” “88h” to the register SYS_REGLCTL continuously. Any different data value, different sequence or any other write to other address during these three data writing will abort the whole sequence.

After the protection is disabled, user can check REGLCTL (SYS_REGLCTL [0]), “1” is protection disable, “0” is protection enable. Then user can update the target protected register value and then write any data to SYS_REGLCTL to enable register protection.

The protected registers are listed in Table 6.2-6.

Register	Bit	Description
SYS_IPRST0	[2] GDMARST	GDMA One-shot Reset (Write Protect)
	[1] CPURST	Processor Core One-shot Reset (Write Protect)
	[0] CHIPRST	Chip One-shot Reset (Write Protect)
SYS_BODCTL	[15] LVREN	Low Voltage Reset Enable Control (Write Protect)
	[6] LVRLPM	Low Voltage Reset Low Power Mode (Write Protect)
	[4] BODRSTEN	Brown-out Reset Enable Control (Write Protect)
	[3:1] BODVL	Brown-out Detector Threshold Voltage Selection (Write Protect)
	[0] BODEN	Brown-out Detector Enable Control (Write Protect)
SYS_PORCTL	[15:0] POROFF	Power-on Reset Enable Control (Write Protect)
INT_NMICTL	[8] NMISELEN	NMI Interrupt Enable Control (Write Protected)
CLK_PWRCTL		
	[7] PDEN	System Power-down Enable Control (Write Protect)
	[5] PDWKIEN	Power-down Mode Wake-up Interrupt Enable Control (Write Protect)
	[4] PDWKDLY	Wake-up Delay Counter Enable Control (Write Protect)
	[3] LIRCEN	LIRC Enable Control (Write Protect)
	[2] HIRCEN	HIRC Enable Control (Write Protect)
	[1:0] EXTCLKEN	XTL Enable Control (Write Protect)
CLK_APBCLK	[0] WDTCKEN	Watchdog Timer Clock Enable Control (Write Protect)
CLK_CLKSEL0	[4:3] STCLKSEL	Cortex®-M0 SysTick Clock Source Selection (Write Protect)
	[1:0] HCLKSEL	HCLK Clock Source Selection (Write Protect)
CLK_CLKSEL1	[1:0] WDTSEL	Watchdog Timer Clock Source Selection (Write Protect)
FMC_ISPCTL	[6] ISPFF	ISP Fail Flag (Write Protect)
	[5] LDUEN	LDROM Update Enable Control (Write Protect)
	[4] CFGUEN	CONFIG Update Enable Control (Write Protect)

	[3] APUEN	APROM Update Enable Control (Write Protect)
	[2] SPUEN	SPROM Update Enable Control (Write Protect)
	[1] BS	Boot Select (Write Protect)
	[0] ISPEN	ISP Enable Control (Write Protect)
FMC_ISPTRG	[0] ISPGO	ISP Start Trigger (Write Protect)
FMC_ISPSTS	[6] ISPFF	ISP Fail Flag (Write Protect)
TIMER0_CTL	[31] ICEDEBUG	ICE Debug Mode Acknowledge Disable Control (Write Protect)
TIMER1_CTL	[31] ICEDEBUG	ICE Debug Mode Acknowledge Disable Control (Write Protect)
TIMER2_CTL	[31] ICEDEBUG	ICE Debug Mode Acknowledge Disable Control (Write Protect)
WDT_CTL	[31] ICEDEBUG	ICE Debug Mode Acknowledge Disable Control (Write Protect)
	[7] WDTEN	Watchdog Timer Enable Control (Write Protect)
	[6] INTEN	Watchdog Timer Time-out Interrupt Enable Control (Write Protect)
	[4] WKEN	Watchdog Timer Time-out Wake-up Function Control (Write Protect)
	[1] RSTEN	Watchdog Timer Time-out Reset Enable Control (Write Protect)
	[0] RSTCNT	Reset Watchdog Timer Up Counter (Write Protect)

Table 6.2-6 Protected Registers

6.2.7 Memory Organization

6.2.7.1 Overview

The NuMicro® NM1240 series provides 4G-byte addressing space. The addressing space assigned to each on-chip controllers is shown in Figure 6.2-8. The detailed register definition, addressing space, and programming details will be described in the following sections for each on-chip peripheral. The NM1240 series only supports little-endian data format.

Figure 6.2-8 NuMicro® NM1240 Flash, Security and Configuration Map

6.2.7.2 System Memory Map

The NM1240 series provides 4G-byte addressing space. The memory locations assigned to each on-chip controllers are shown in Table 6.2-7 Address Space Assignments for On-Chip Modules. The detailed register definition, memory space, and programming will be described in the following sections for each on-chip peripheral. The NM1240 series only supports little-endian data format.

The memory locations assigned to each on-chip controllers are shown in Table 6.2-7 Address Space Assignments for On-Chip Modules..

Address Space	Token	Controllers
Flash and SRAM Memory Space		
0x0000_0000 – 0x0000_FFFF	FLASH_BA	FLASH Memory Space (64KB)
0x0010_0000 – 0x0010_1DFF	LD_BA	Loader Memory Space (7.5 KB)
0x0020_0000 – 0x0020_01FF	SP0_BA	Security Program Memory 0 Space (0.5 KB)
0x0024_0000 – 0x0024_01FF	SP1_BA	Security Program Memory 1 Space (0.5 KB)
0x0028_0000 – 0x0028_01FF	SP2_BA	Security Program Memory 2 Space (0.5 KB)
0x0030_0000 – 0x0030_01FF	CFG_BA	CONFIG Program Memory Space (0.5 KB)
0x2000_0000 – 0x2000_1FFF	SRAM_BA	SRAM Memory Space (8 KB)
AHB Modules Space (0x5000_0000 – 0x501F_FFFF)		
0x5000_0000 – 0x5000_01FF	SYS_BA	System Control Registers
0x5000_0200 – 0x5000_02FF	CLK_BA	Clock Control Registers
0x5000_0300 – 0x5000_03FF	INT_BA	Interrupt Multiplexer Control Registers
0x5000_4000 – 0x5000_7FFF	GPIO_BA	GPIO Control Registers
0x5000_8000 – 0x5000_8FFF	GDMA_BA	GDMA Control Registers
0x5000_C000 – 0x5000_FFFF	FMC_BA	Flash Memory Control Registers
0x5001_4000 – 0x5001_7FFF	HDIV_BA	Hardware Divider and CRC16 Control Register
APB Controllers Space (0x4000_0000 ~ 0x401F_FFFF)		
0x4000_4000 – 0x4000_7FFF	WDT_BA	Watchdog Timer Control Registers
0x4001_0000 – 0x4001_3FFF	TMR02_BA	Timer0/Timer1/Timer2 Control Registers

0x4004_0000 – 0x4004_3FFF	EPWM_BA	Enhance PWM Control Registers
0x400D_0000 – 0x400D_3FFF	ACMP_BA	Analog Comparator 0 Control Registers
0x400E_0000 – 0x400E_3FFF	ADC_BA	ADC Control Registers
0x400F_0000 – 0x400F_3FFF	OP_BA	OP Amplifier Control Register
0x4014_0000 – 0x4014_3FFF	BPWM_BA	Basic PWM Control Registers
0x4017_0000 – 0x4017_3FFF	USCI1_BA	USCI1 Control Registers
0x401B_0000 – 0x401B_3FFF	ECAP_BA	Enhanced Input Capture Timer Register
0x4027_0000 – 0x4027_3FFF	USCI2_BA	USCI2 Control Registers
System Controllers Space (0xE000_E000 ~ 0xE000_EFFF)		
0xE000_E010 – 0xE000_E0FF	SCS_BA	System Timer Control Registers
0xE000_E100 – 0xE000_ECFF	SCS_BA	External Interrupt Controller Control Registers
0xE000_ED00 – 0xE000_ED8F	SCS_BA	System Control Registers

Table 6.2-7 Address Space Assignments for On-Chip Modules

6.2.7.3 SRAM Memory Organization

The NM1240 supports embedded SRAM with total 8 Kbytes size.

- Supports total 8 Kbytes SRAM
- Supports byte / half word / word write
- Supports oversize response error

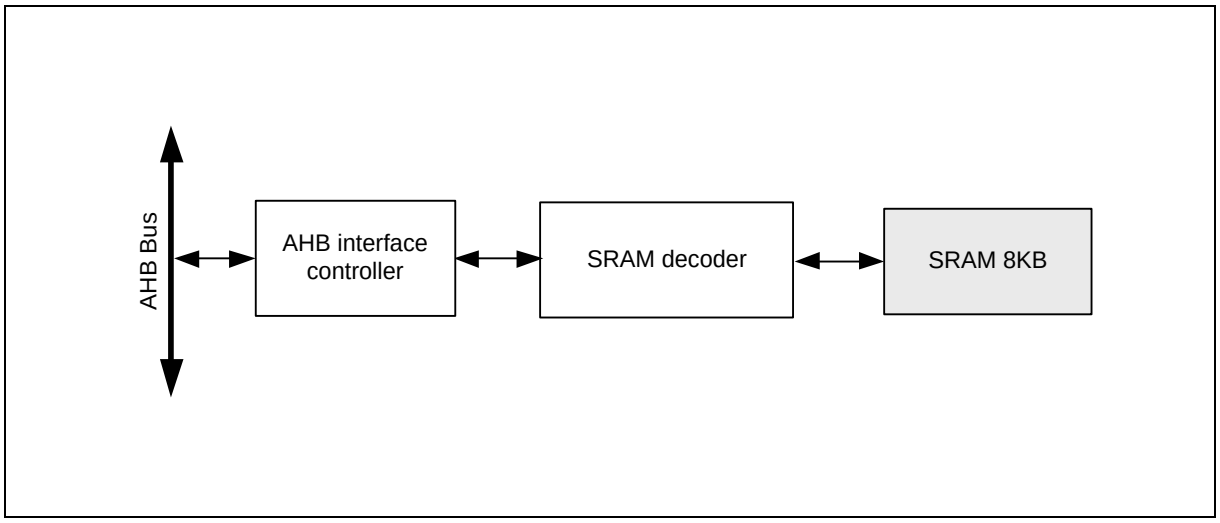


Figure 6.2-9 SRAM Block Diagram

6.2.8 System Timer (SysTick)

The Cortex®-M0 includes an integrated system timer, SysTick, which provides a simple, 24-bit cleared-on-write, decrementing, wrap-on-zero counter with a flexible control mechanism. The counter can be used in several different ways, for example:

An RTOS tick timer fires at a programmable rate (for example 100Hz) and invokes a SysTick routine.

A high-speed alarm timer uses Core clock.

A variable rate alarm or signal timer – the duration range is dependent on the reference clock used and the dynamic range of the counter.

A simple counter can be used by software to measure task completion time.

An internal Clock Source control based on missing/meeting durations. The COUNTFLAG bit-field in the control and status register can be used to determine if an action completed within a set duration, as part of a dynamic clock management control loop.

When enabled, the timer will count down from the value in the SysTick Current Value Register (SYST_CVR) to 0, and reload (wrap) to the value in the SysTick Reload Value Register (SYST_RVR) on the next clock edge, and then decrement on subsequent clocks. When the counter transitions to 0, the COUNTFLAG status bit is set. The COUNTFLAG bit clears on read.

The SYST_CVR value is UNKNOWN on reset. Software should write to the register to clear it to 0 before enabling the feature. This ensures the timer will count from the SYST_RVR value rather than an arbitrary value when it is enabled.

If the SYST_RVR is zero, the timer will be maintained with a current value of zero after it is reloaded with this value. This mechanism can be used to disable the feature independently from the timer enable bit.

For more detailed information, please refer to the “ARM® Cortex®-M0 Technical Reference Manual” and “ARM® v6-M Architecture Reference Manual”.

6.2.8.1 System Timer Control Register Map

R: read only**, W:** write only**, R/W:** both read and write**, W&C:** write 1 to clear

Register	Offset	R/W	Description	Reset Value
SCS Base Address: **SCS_BA = 0xE000_E000**				
SYST_CTL	SCS_BA+0x10	R/W	SysTick Control and Status	0x0000_0004
SYST_RVR	SCS_BA+0x14	R/W	SysTick Reload Value Register	0xXXXX_XXXX
SYST_CVR	SCS_BA+0x18	R/W	SysTick Current Value Register	0xXXXX_XXXX

6.2.8.2 System Timer Control Register Description

SysTick Control and Status （SYST_CTL）

Register	Offset	R/W	Description	Reset Value
SYST_CTL	SCS_BA+0x10	R/W	SysTick Control and Status	0x0000_0004

31	30	29	28	27	26	25	24

Bits	Description	
[31:24]	**Reserved**	Reserved.
[23:0]	**CURRENT**	**System Tick Current Value** Current counter value. This is the value of the counter at the time it is sampled. The counter does not provide read-modify-write protection. The register is write-clear. A software write of any value will clear the register to 0.

6.2.9 Nested Vectored Interrupt Control (NVIC)

6.2.9.1 Overview

The Cortex®-M0 CPU provides an interrupt controller as an integral part of the exception mode, named as “Nested Vectored Interrupt Controller (NVIC)”, which is closely coupled to the processor core and provides following features.

6.2.9.2 Features

- Nested and Vectored interrupt support
- Automatic processor state saving and restoration
- Dynamic priority change
- Reduced and deterministic interrupt latency

The NVIC prioritizes and handles all supported exceptions. All exceptions are handled in “Handler Mode”. This NVIC architecture supports 32 (IRQ[31:0]) discrete interrupts with 4 levels of priority. All of the interrupts and most of the system exceptions can be configured to different priority levels. When an interrupt occurs, the NVIC will compare the priority of the new interrupt to the current running one’s priority. If the priority of the new interrupt is higher than the current one, the new interrupt handler will override the current handler.

When an interrupt is accepted, the starting address of the Interrupt Service Routine (ISR) is fetched from a vector table in memory. There is no need to determine which interrupt is accepted and branch to the starting address of the correlated ISR by software. While the starting address is fetched, NVIC will also automatically save processor state including the registers “PC, PSR, LR, R0~R3, R12” to the stack. At the end of the ISR, the NVIC will restore the mentioned registers from stack and resume the normal execution. Thus it will take less and deterministic time to process the interrupt request.

The NVIC supports “Tail Chaining” which handles back-to-back interrupts efficiently without the overhead of states saving and restoration and therefore reduces delay time in switching to pending ISR at the end of current ISR. The NVIC also supports “Late Arrival” which improves the efficiency of concurrent ISRs. When a higher priority interrupt request occurs before the current ISR starts to execute (at the stage of state saving and starting address fetching), the NVIC will give priority to the higher one without delay penalty. Thus it advances the real-time capability.

For more detailed information, please refer to the “ARM® Cortex®-M0 Technical Reference Manual” and “ARM® v6-M Architecture Reference Manual”.

The processor automatically stacks its state on exception entry and unstacks this state on exception exit, with no instruction overhead. This provides low latency exception handling.

6.2.9.3 Exception Model and System Interrupt Map

Table 6.2-8 lists the exception model supported by the NM1240 series. Software can set four levels of priority on some of these exceptions as well as on all interrupts. The highest user-configurable priority is denoted as 0 and the lowest priority is denoted as 3. The default priority of all the user-configurable interrupts is 0. Note that the priority 0 is treated as the fourth priority on the system, after three system exceptions “Reset”, “NMI” and “Hard Fault”.

Exception Name	Vector Number	Priority
Reset	1	-3
NMI	2	-2
Hard Fault	3	-1
Reserved	4 ~ 10	Reserved
SVCall	11	Configurable
Reserved	12 ~ 13	Reserved
PendSV	14	Configurable
SysTick	15	Configurable
Interrupt (IRQ0 ~ IRQ31)	16 ~ 47	Configurable

Table 6.2-8 Exception Model

Vector Number	Interrupt Number (Bit In Interrupt Registers)	Interrupt Name	Interrupt Description
0 ~ 15	-	-	System exceptions
16	0	BOD_OUT	Brown-Out low voltage detected interrupt
17	1	WDTPINT	Watchdog Timer interrupt
18	2	Reserved	Reserved
19	3	USCI1_INT	USCI1 interrupt
20	4	GP_INT	External interrupt from GPA ~ GPF pins
21	5	EPWM_INT	EPWM interrupt
22	6	BRAKE0_INT	EPWM brake interrupt from PWM0 or PWM_BRAKE pin
23	7	BRAKE1_INT	EPWM brake interrupt from PWM1
24	8	BPWM0_INT	BPWM0 interrupt
25	9	BPWM1_INT	BPWM1 interrupt
26	10	Reserved	Reserved
27	11	USCI2_INT	USCI2 interrupt
28	12	Reserved	Reserved
29	13	Reserved	Reserved
30	14	Reserved	Reserved
31	15	ECAP_INT	Enhanced Input Capture interrupt
32	16	CCAP_INT	Continues Input Capture interrupt
33	17	Reserved	Reserved

34	18	Reserved	Reserved
35	19	GDMA_INT0	GDMA_CH0 interrupt
36	20	GDMA_INT1	GDMA_CH1 interrupt
37	21	HIRCTRIM_INT	HIRC TRIM interrupt
38	22	TMR0_INT	Timer 0 interrupt
39	23	TMR1_INT	Timer 1 interrupt
40	24	TMR2_INT	Timer 2 nterrupt
41	25	Reserved	Reserved
42	26	ACMP_INT	Analog Comparator 0 or Comparator 1 interrupt
43	27	Reserved	Reserved
44	28	PWRWU_INT	Chip wake-up from Power-down state interrupt
45	29	ADC0_INT	ADC0 interrupt
46	30	ADC1_INT	ADC1 interrupt
47	31	Reserved	Reserved

Table 6.2-9 System Interrupt Map Vector Table

6.2.9.4 Vector Table

When an interrupt is accepted, the processor will automatically fetch the starting address of the interrupt service routine (ISR) from a vector table in memory. For ARMv6-M, the vector table based address is fixed at 0x00000000. The vector table contains the initialization value for the stack pointer on reset, and the entry point addresses for all exception handlers. The vector number on previous page defines the order of entries in the vector table associated with the exception handler entry as illustrated in previous section.

Vector Table Word Offset (Bytes)	Description
0x00	Initial Stack Pointer Value
Exception Number * 0x04	Exception Entry Pointer using that Exception Number

Table 6.2-10 Vector Table Format

6.2.9.5 Operation Description

The NVIC interrupts can be enabled and disabled by writing to their corresponding Interrupt Set-Enable or Interrupt Clear-Enable register bit-field. The registers use a write-1-to-enable and write-1-to-clear policy, both registers reading back the current enabled state of the corresponding interrupts. When an interrupt is disabled, interrupt assertion will cause the interrupt to become Pending, however, the interrupt will not activate. If an interrupt is Active when it is disabled, it remains in its Active state until cleared by reset or an exception return. Clearing the enable bit prevents new activations of the associated interrupt.

NVIC interrupts can be pended/un-pended using a complementary pair of registers to those used to enable/disable the interrupts, named the Set-Pending Register and Clear-Pending Register

respectively. The registers use a write-1-to-enable and write-1-to-clear policy, both registers reading back the current pended state of the corresponding interrupts. The Clear-Pending Register has no effect on the execution status of an Active interrupt.

NVIC interrupts are prioritized by updating an 8-bit field within a 32-bit register (each register supporting four interrupts).

The general registers associated with the NVIC are all accessible from a block of memory in the System Control Space and will be described in next section.

6.2.9.6 NVIC Control Registers Map

R: read only, **W:** write only, **R/W:** both read and write

Register	Offset	R/W	Description	Reset Value
SCS Base Address: **SCS_BA = 0xE000_E000**				
NVIC_ISER	SCS_BA+0x100	R/W	IRQ0 ~ IRQ31 Set-enable Control Register	0x0000_0000

IRQ							
7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
IRQ							

Bits	Description	
[31:0]	**IRQ**	**MCU IRQ Source Register** The IRQ collects all the interrupts from the peripherals and generates the synchronous interrupt to Cortex®-M0 core. There is one mode to generate interrupt to Cortex®-M0 - the normal mode. The IRQ collects all interrupts from each peripheral and synchronizes them then interrupts the Cortex®-M0. When the IRQ[n] is 0, setting IRQ[n] to 1 will generate an interrupt to Cortex®-M0 NVIC[n]. When the IRQ[n] is 1 (i.e. an interrupt is assert), setting 1 to the MCU_bit[n] will clear the interrupt and setting IRQ[n] 0 has no effect.

6.2.10 System Control Registers

Key control and status features of Cortex®-M0 are managed centrally in a System Control Block within the System Control Registers.

For more detailed information, please refer to the “ARM® Cortex®-M0 Technical Reference Manual” and “ARM® v6-M Architecture Reference Manual”.

6.3 Clock Controller

6.3.1 Overview

The clock controller generates clocks for the whole chip, including system clocks and all peripheral clocks. The clock controller also implements the power control function with the individual clock ON/OFF control, clock source selection and clock divider. The chip enters Power-down mode when the Cortex®-M0 core executes the WFI instruction only if the PDEN (CLK_PWRCTL[7]) bit set to 1. After that, chip enters Power-down mode and waits for wake-up interrupt source triggered to exit Power-down mode. In Power-down mode, the clock controller turns off the external clock input (EXT_CLK) and 48(60) MHz internal high speed RC oscillator (HIRC) to reduce the overall system power consumption. Figure 6.3-1 shows the clock generator and the overview of the clock source control.

6.3.2 Clock Diagram

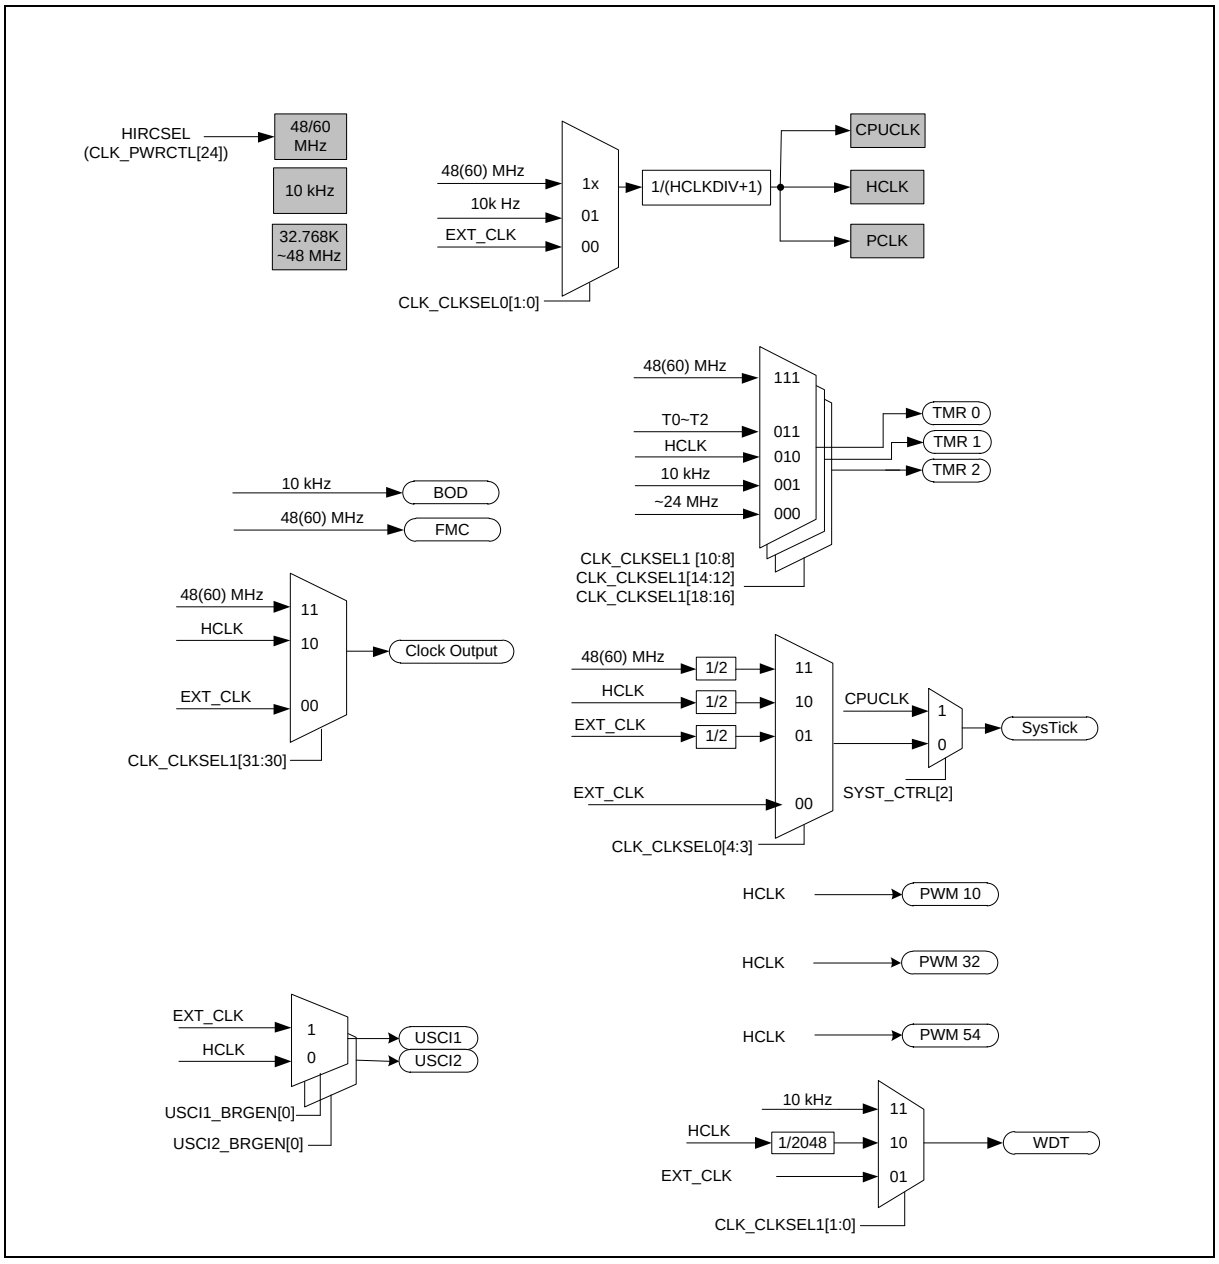

Figure 6.3-1 Clock Generator Global View Diagram

6.3.3 Clock Generator

The clock generator consists of 3 clock sources, which are listed below:

- External clock input (EXT_CLK)
- 48(60) MHz internal high speed RC oscillator (HIRC)
- 10 kHz internal low speed RC oscillator (LIRC)

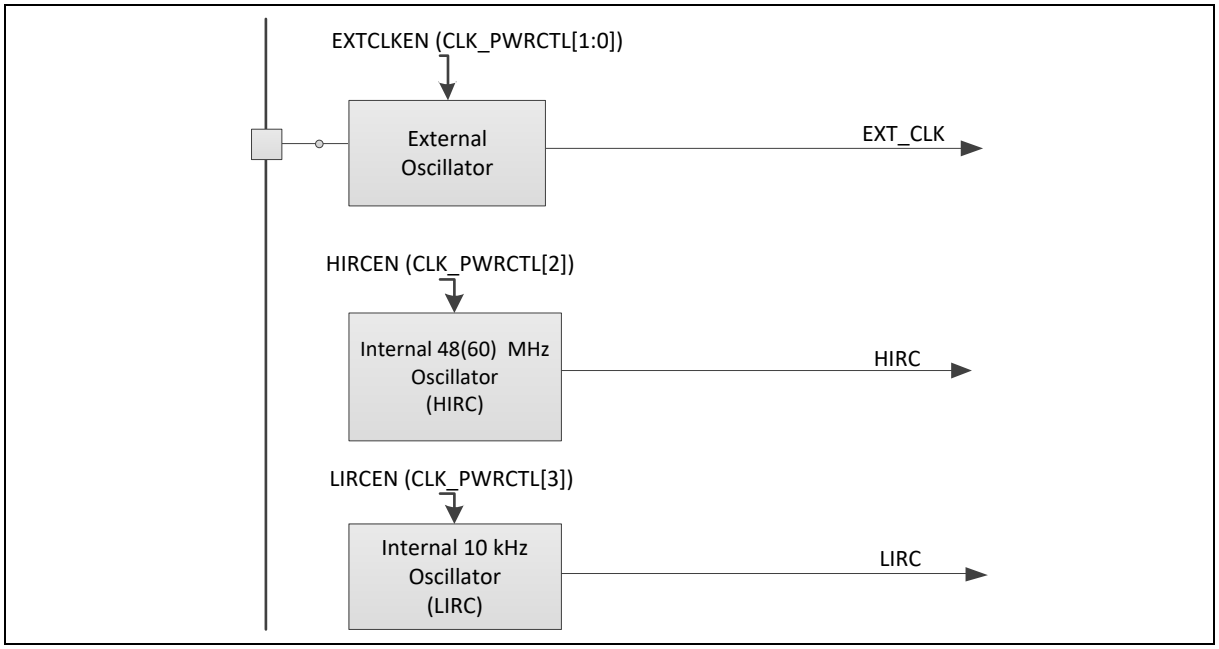

Figure 6.3-2 Clock Generator Block Diagram

6.3.4 System Clock and SysTick Clock

The system clock has three clock sources which were generated from clock generator block. The clock source switch depends on the register HCLKSEL (CLK_CLKSEL0[1:0]). The block diagram is shown in Figure 6.3-3.

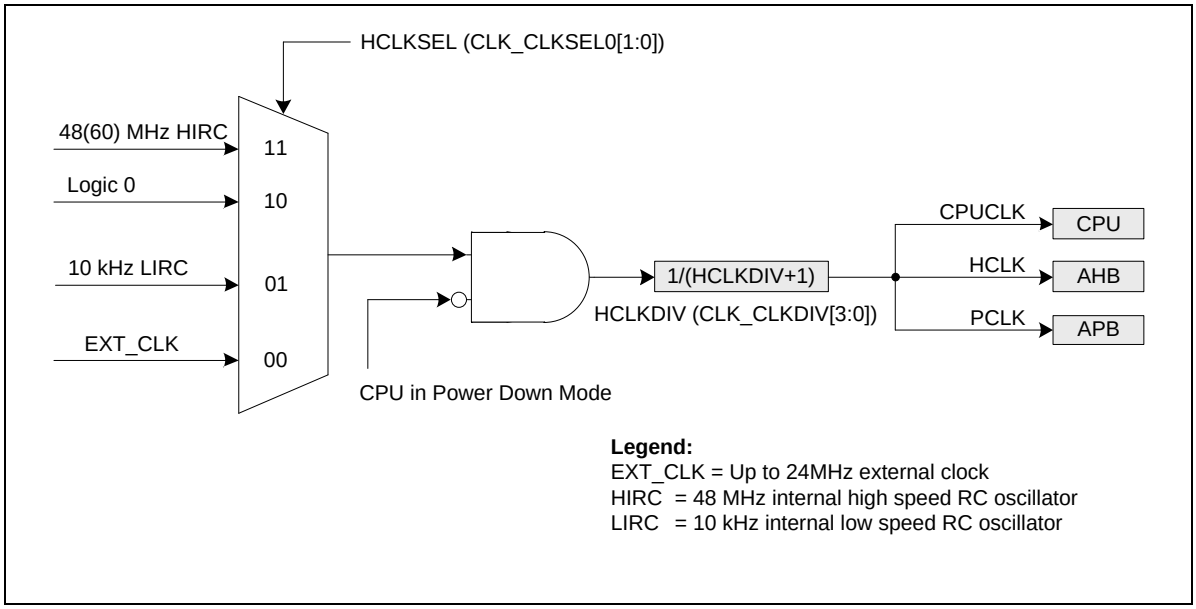

Figure 6.3-3 System Clock Block Diagram

The clock source of SysTick in the Cortex®-M0 core can use CPU clock or external clock (SYST_CTL[2]). If using external clock, the SysTick clock (STCLK) has 4 clock sources. The clock source switch depends on the setting of the register STCLKSEL (CLK_CLKSEL0[4:3]). The block diagram is shown in Figure 6.3-4.

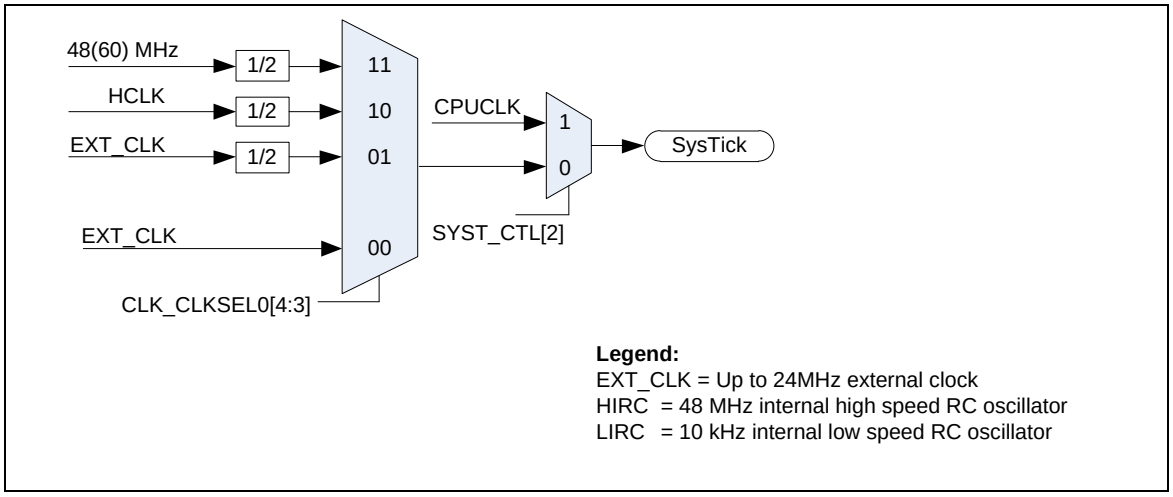

Figure 6.3-4 SysTick Clock Control Block Diagram

6.3.5 AHB Clock Source Selection

The clock source of ISP is from AHB clock (HCLK). Please refer to register CLK_AHBCLK.

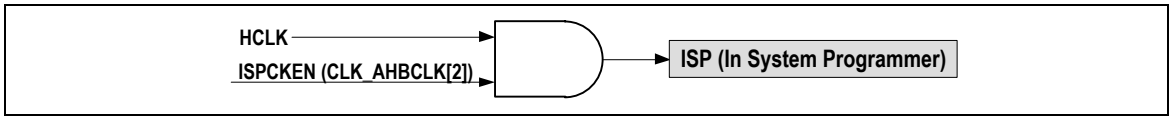

Figure 6.3-5 AHB Clock Source for HCLK

6.3.6 Peripherals Clock Source Selection

The peripheral clock has different clock source switch settings depending on different peripherals. Please refer to the CLK_CLKSEL1 and CLK_APBCLK register description in section 錯誤! 找不到參照來源。.

6.3.7 Power-down Mode Clock

When entering Power-down mode, system clocks, some clock sources and some peripheral clocks are disabled. Some clock sources and peripherals clock are still active in Power-down mode.

The clocks still kept active are listed below:

- Clock Generator
- 10 kHz internal low speed oscillator (LIRC) clock
- Peripherals Clock (When 10 kHz low speed oscillator is adopted as clock source)
  - Watchdog Clock
  - Timer 0/1/2 Clock

6.3.8 Frequency Divider Output

This device is equipped with a power-of-2 frequency divider which is composed of 16 chained divide-by-2 shift registers. One of the 16 shift register outputs selected by a sixteen to one multiplexer is reflected to the CLKO pin. Therefore there are 16 options of power-of-2 divided clocks with the frequency from $F_{in}/2^1$ to $F_{in}/2^{16}$ where F_{in} is input clock frequency to the clock divider.

The output formula is $\boldsymbol{F_{out} = F_{in}/2^{(N+1)}}$, where F_{in} is the input clock frequency, F_{out} is the clock divider output frequency and N is the 4-bit value in FREQSEL (CLK_CLKOCTL[3:0]).

When writing 1 to CLKOEN (CLK_CLKOCTL[4]), the chained counter starts to count. When writing 0 to CLKOEN (CLK_CLKOCTL[4]), the chained counter continuously runs till the divided clock reaches low state and stay in low state.

if DIV1EN(CLK_CLKOCTL[5]) set to 1, the frequency divider clock will bypass power-of-2 frequency divider. The frequency divider clock will be output to the CLKO pin directly.

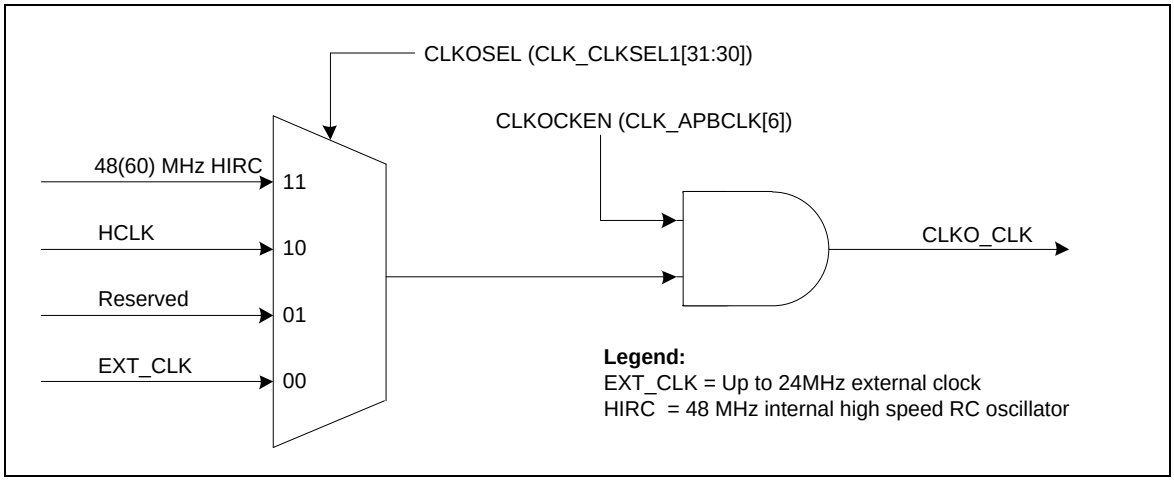

Figure 6.3-6 Clock Source of Frequency Divider

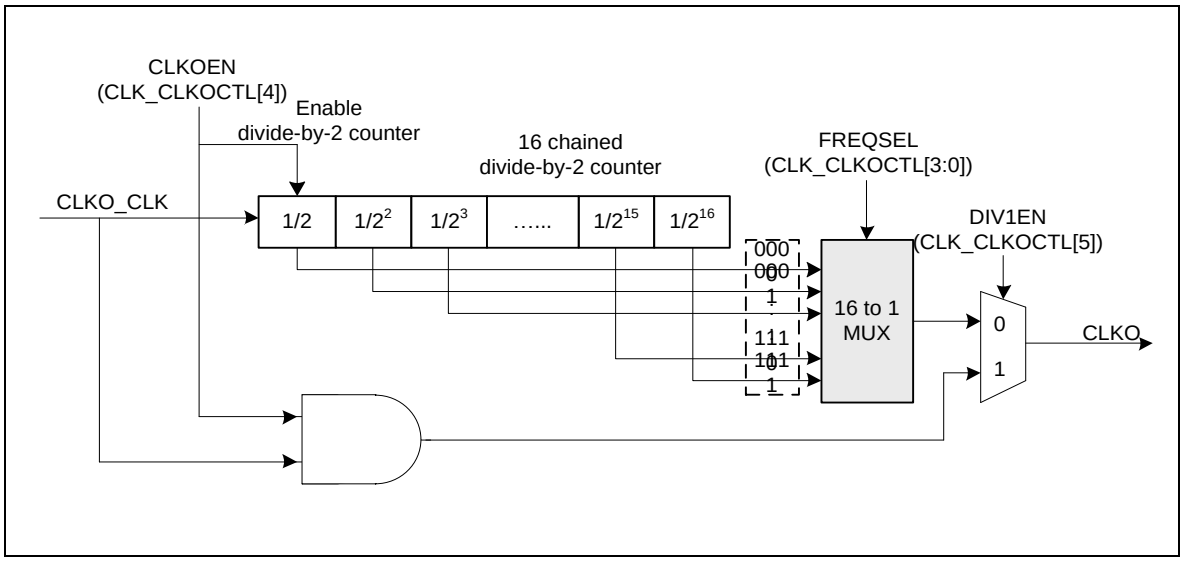

Figure 6.3-7 Block Diagram of Frequency Divider

6.4 Flash Memory Controller (FMC)

6.4.1 Overview

The NM1240 series is equipped with 48/64 Kbytes on chip embedded Flash EPROM for application program memory (APROM) that can be updated through ISP procedure. In System Programming (ISP) function enables user to update program memory when the chip is soldered on PCB. After chip powered on Cortex®-M0 CPU fetches code from APROM or LDROM decided by boot select (CBS) in Config0. By the way, the NM1240 series also provides Data Flash Region, where the Data Flash is shared with original program memory and its start address is configurable and defined by user in Config1. The Data Flash size is defined by user depending on the application request. Security program memory (SPROM) provides user to protect any program code within SPROM.

6.4.2 Features

- Running up to 48(60) MHz with one wait state and 24 MHz without wait state for discontinuous address read access
- 48/64 Kbytes application program memory (APROM)
- 7.5 Kbytes in system programming (ISP) loader program memory (LDROM)
- Programmable Data Flash start address and memory size with 512 bytes page erase unit
- Three 512 bytes security program memory (SPROM)
- In System Program (ISP)/In Application Program (IAP) to update on chip Flash EPROM

6.5 General Purpose I/O (GPIO)

6.5.1 Overview

The NM1240 series has up to 44 General Purpose I/O pins and one input pin. These pins could be shared with other functions depending on the chip configuration. 44 pins are arranged in 6 ports named as PA, PB, PC, PD, PE and PF. Each of the 44 pins is independent and has the corresponding register bits to control the pin mode function and data.

The I/O type of each of I/O pins can be configured by software individually as Input, Push-pull output, Open-drain output or Quasi-bidirectional mode. After the chip is reset, the I/O mode of all pins are depending on CIOIN (CONFIG0[10]).

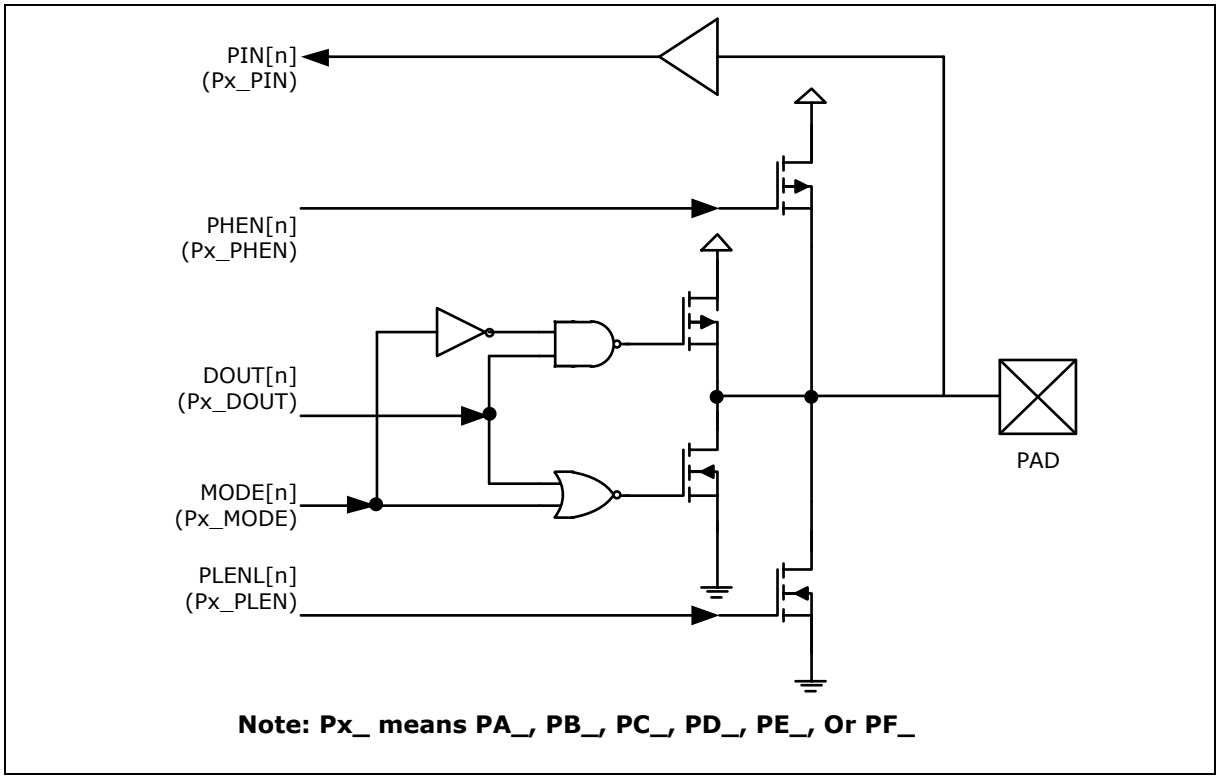

Figure 6.5-1 I/O Pin Block Diagram

6.5.2 Features

- Four I/O modes:
  - Quasi-bidirectional mode
  - Push-Pull Output mode
  - Open-Drain Output mode
  - Input only with high impendence mode
- TTL/Schmitt trigger input selectable
- I/O pin can be configured as interrupt source with edge/level setting
- Supports High Drive and High Slew Rate I/O mode

- Configurable default I/O mode of all pins after reset by CIOINI (CONFIG0[10]) setting
  - CIOIN = 0, all GPIO pins in Quasi-bidirectional mode after chip reset
  - CIOIN = 1, all GPIO pins in input mode after chip reset
- All GPIO supports the pull-up and pull-low resistor enabled in four I/O modes
- Enabling the pin interrupt function will also enable the wake-up function

6.6 Timer Controller (TIMER)

6.6.1 Overview

The Timer Controller includes three 32-bit timers, TIMER0 ~ TIMER2, allowing user to easily implement a timer control for applications. The timer can perform functions, such as frequency measurement, delay timing, clock generation, and event counting by external input pins, and interval measurement by external capture pins.

6.6.2 Features

- Supports three sets of 32-bit timers with 24-bit up-timer and one 8-bit pre-scale counter
- Supports independent clock source for each channel (TMR0/1/2_CLK)
- Supports three timer counting modes: one-shot, periodic, toggle and continuous counting
- Time-out period = (period of timer clock input) * (8-bit pre-scale counter + 1) * (24-bit CMPDAT)
- Supports maximum counting cycle time = (1 / T MHz) * (2^8) * (2^{24}); T is the period of timer clock
- 24-bit up counter value is readable through TIMERx_CNT (Timer Data Register)
- Supports event counting function to count the event from external pin (TM0/1/2)
- Supports internal capture triggered while internal ACMP output signal transition
- Supports chip wake-up from Idle/Power-down mode if a timer interrupt signal is generated

6.7 Enhanced Input Capture Timer (ECAP)

6.7.1 Overview

This device provides an Input Capture Timer/Counter whose capture function can detect the digital edge-changed signal at channel inputs. This unit has three input capture channels. The timer/counter is equipped with up counting, reload and compare-match capabilities.

6.7.2 Features

- Supports the interrupt function
- Each input channel has its own capture counter hold register
- 24-bit Input Capture up-counting timer/counter
- With noise filter in front end of input ports
- Edge detector with three options
  - Rising edge detection
  - Falling edge detection
  - Both edge detection
- Each input channel is supported with one capture counter hold register
- Captured event reset and/or reload capture counter
- Supports compare-match function
-

6.8 Enhanced PWM Generator (EPWM)

6.8.1 Overview

The NM1240 has built in one PWM unit which is specially designed for motor driving control applications. The PWM unit supports six PWM generators which can be configured as six independent PWM outputs, PWM0~PWM5, or as three complementary PWM pairs, (PWM0, PWM1), (PWM2, PWM3) and (PWM4, PWM5) with three programmable dead-zone generators.

Every complementary PWM pairs share one clock divider providing nine divided frequencies (1, 1/2, 1/4, 1/8, 1/16, 1/32, 1/64, 1/128, 1/256) for each channel. Each PWM output shares one 16-bit counter for PWM period control, and 16-bit comparators for PWM duty control. The six PWM generators provide fourteen independent PWM interrupt flags which are set by hardware when the corresponding PWM period counter comparison matched period and duty. Each PWM interrupt source with its corresponding enable bit can request PWM interrupt. The PWM generators can be configured as One-shot mode to produce only one PWM cycle signal or Auto-reload mode to output PWM waveform continuously.

To prevent PWM driving output pin with unsteady waveform, the 16-bit period up counter and 16-bit comparator are implemented with double buffer. When user writes data to counter/comparator buffer registers, the updated value will be loaded into the 16-bit counter/comparator at the end of current period. The double buffering feature avoids glitch at PWM outputs.

Besides PWM, Motor controlling also need Timer, ACMP and ADC to work together. To control motor more precisely, some registers are provided to configure not only PWM but also Timer, ADC and ACMP. By doing so, it can save more CPU time and control motor with ease especially in BLDC.

6.8.2 Features

- Supports one PWM clock timer and one 9 level Divider (1, 1/2, 1/4, 1/8, 1/16, 1/32, 1/64, 1/128, 1/256).
- Supports six independent 16-bit PWM duty control units with maximum six port pins:
  - Six independent PWM outputs – PWM0, PWM1, PWM2, PWM3, PWM4, and PWM5
  - Three complementary PWM pairs, with each pin in a pair mutually complement to each other and capable of programmable dead-zone insertion – (PWM0, PWM1), (PWM2, PWM3) and (PWM4, PWM5)
- Supports group function.
- Supports one-shot (only edge alignment mode) or auto-reload mode PWM
- Supports 16-bit resolution PWM counter
- Supports Edge-aligned and Center-aligned mode
- Supports Programmable dead-zone insertion between complementary paired PWMs
- Supports hardware fault brake protections
  - Two Interrupt types, BRK0 and BRK1:
    - BRK0 forces EPWM in brake state and resumed by software
    - BRK1 forces EPWM in brake state and auto-resumed by hardware
    - Brake source:
      - BRK0: ACMP0, ACMP1, EADC and External pins (PWM_BRK_Px)

- BRK1: ACMP0, ACMP1, EADC and External pins (PWM_BRK_Px).

- The PWM signals before polarity control stage are defined in the view of positive logic. The PWM ports is active high or active low are controlled by polarity control register.
- Supports independently falling CMPDAT matching, central matching (in Center-aligned mode), rising CMPDAT matching (in Center-aligned mode), period matching to trigger EADC conversion
- Supports ACMP output event trigger PWM to force PWM output at most one period low
- Supports interrupt accumulation function

6.9 Basic PWM Generator (BPWM)

6.9.1 Overview

The NM1240 series has one set of BPWM group supporting one set of PWM generator that can be configured as 2 independent PWM outputs, PWM20~PWM21, or as 1 complementary PWM pairs, (PWM20, PWM21) with programmable Dead-zone generators.

The PWM generator has one 8-bit pre-scalar, one clock divider with 5 divided frequencies (1, 1/2, 1/4, 1/8, 1/16), two PWM Timers including two clock selectors, two 16-bit PWM up/down-counters for PWM period control, two 16-bit comparators for PWM duty control and one dead-zone generator. The PWM generator provides two independent PWM interrupt flags which are set by hardware when the corresponding PWM period down counter reaches zero. Each PWM interrupt source with its corresponding enable bit can cause CPU to request PWM interrupt. The PWM generators can be configured as one-shot mode to produce only one PWM cycle signal or auto-reload mode to output PWM waveform continuously.

When DTCNT01(BPWM_CTL[4]) is set, PWM20 and PWM21 perform complementarily; the paired PWM timing, period, duty and dead-time are determined by PWM0 timer and Dead-zone generator 0. Refer to **錯誤! 找不到參照來源。** for the architecture of Basic PWM Timers.

To prevent PWM driving output pin from glitches, the 16-bit period down counter and 16-bit comparator are implemented with double buffer. When user writes data to counter/comparator buffer registers the updated value will be load into the 16-bit down counter/ comparator at the time down counter reaching zero. The double buffering feature avoids glitch at PWM outputs.

When the 16-bit period down counter reaches zero, the interrupt request is generated. If PWM-timer is set as auto-reload mode, when the down counter reaches zero, it is reloaded with BPWM Counter Register(BPWM_PERIODx, x=0,1) automatically then start decreasing, repeatedly. If the PWM-timer is set as one-shot mode, the down counter will stop and generate one interrupt request when it reaches zero.

The value of PWM counter comparator is used for pulse high width modulation. The counter control logic changes the output to high level when down-counter value matches the value of the compare register.

6.9.2 Features

- One PWM generator which supports one 8-bit pre-scalar, one clock divider, two PWM timers (down counter), one dead-zone generator and two PWM outputs.
- Up to 16-bit resolution
- PWM Interrupt request synchronized with PWM period
- One-shot or Auto-reload mode PWM
- Edge-aligned type or Center-aligned type option
- Support synchronous mode with EPWM

6.10 General Direct Memory Access (GDMA)

6.10.1 Overview

The NM1240 supports a two-channel general DMA controller, called the GDMA.

The two-channel GDMA performs the following data transfers without CPU intervention:

- Memory to/from memory or APB device
- Memory to/from USCI TX/RX buffer which supports the hardware trigger

6.10.2 Features

The on-chip GDMA can be started by software. Software can also restart GDMA operation after it has been stopped. The Core can recognize the completion of a GDMA operation either by software polling or by receiving a GDMA interrupt. The GDMA controller can increment and decrement the source address or destination address and perform 8-bit (Byte), 16-bit (Word), or 32-bit (Double-Word) data transfers.

The GDMA includes the following features

- Two channels
- Memory to/from memory or APB device
- Memory to/from USCI TX/RX buffer which supports the hardware trigger
- Compliant with AMBA AHB
- Supports “4-data burst” mode to boost performance

6.11 Watchdog Timer (WDT)

6.11.1 Overview

The Watchdog Timer is used to perform a system reset when system runs into an unknown state. This prevents system from hanging for an infinite period of time. Besides, the Watchdog Timer supports the function to wake-up system from Idle/Power-down mode.

6.11.2 Features

- 18-bit free running up counter for Watchdog Timer time-out interval
- Selectable time-out interval (2^4 ~ 2^{18}) WDT_CLK cycle and the time-out interval period is 104 ms ~ 26.3168 s if WDT_CLK = 10 kHz
- System kept in reset state for a period of (1 / WDT_CLK) * 63
- Supports Watchdog Timer time-out wake-up function only if WDT clock source is selected as 10 kHz

6.12 USCI – Universal Serial Control Interface Controller

6.12.1 Overview

The Universal Serial Control Interface (USCI) is a flexible interface module covering several serial communication protocols. The user can configure this controller as UART, SPI, or I^2C functional protocol.

Note: For detailed USCI UART, I^2C and SPI information, please refer to section 6.13, 6.14, and 6.15.

6.12.2 Features

The controller can be individually configured to match the application needs. The following protocols are supported:

- UART
- SPI
- I^2C

6.13 USCI – UART Mode

6.13.1 Overview

The asynchronous serial channel UART covers the reception and the transmission of asynchronous data frames. It performs a serial-to-parallel conversion on data received from the peripheral, and a parallel-to-serial conversion on data transmitted from the controller. The receiver and transmitter being independent, frames can start at different points in time for transmission and reception.

The UART controller also provides the LIN function. There is incoming data to wake up the system.

6.13.2 Features

- Supports one transmit buffer and two receive buffer for data payload
- Supports programmable baud-rate generator
- Supports 9-Bit Data Transfer
- Supports LIN function
- Baud rate detection possible by built-in capture event of baud rate generator
- Supports GDMA capability
- Supports Wake-up function

6.14 USCI – SPI Mode

6.14.1 Overview

The SPI protocol of USCI controller applies to synchronous serial data communication and allows full duplex transfer. It supports both master and Slave operation mode with the 4-wire bi-direction interface. SPI mode of USCI controller performs a serial-to-parallel conversion on data received from a peripheral device, and a parallel-to-serial conversion on data transmitted to a peripheral device. The SPI mode is selected by FUNMODE (USPI_CTL[2:0]) = 0x1.

The SPI protocol can operate as master or Slave mode by setting the SLAVE (USPI_PROTCTL[0]) to communicate with the off-chip SPI Slave or master device. The application block diagrams in master and Slave mode are shown as Figure 6.14-1 and Figure 6.14-2.

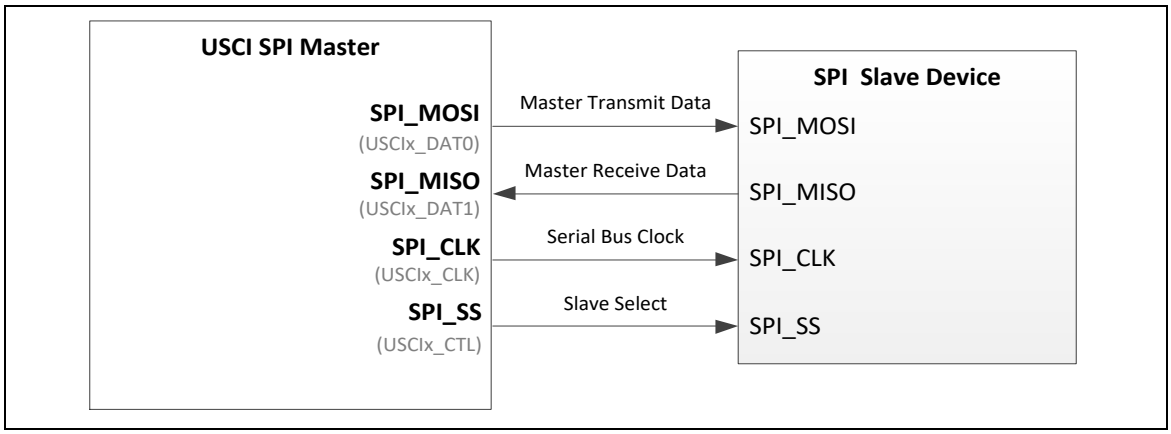

Figure 6.14-1 SPI Master Mode Application Block Diagram (x=1)

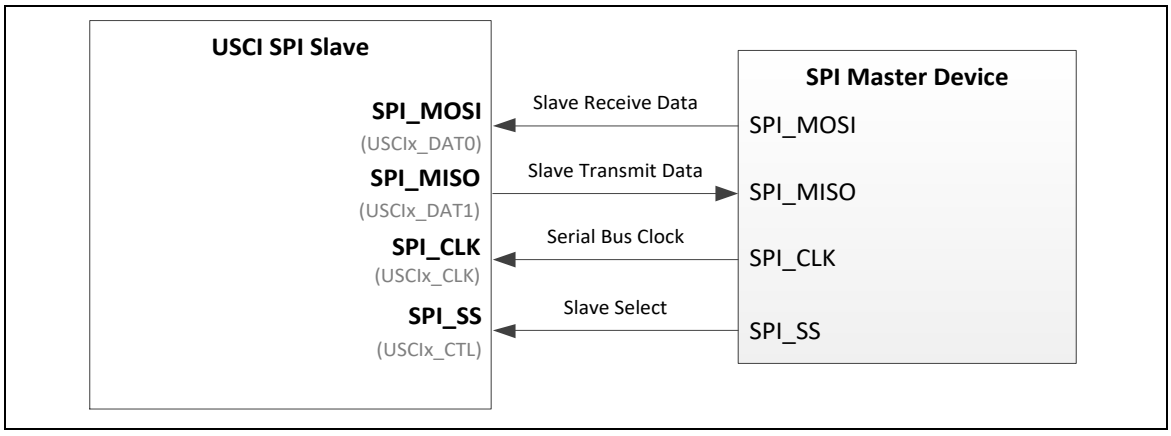

Figure 6.14-2 SPI Slave Mode Application Block Diagram (x=1)

6.14.2 Features

- Supports Master or Slave mode operation (the maximum frequency -- Master = f_{PCLK} / 2, Slave < f_{PCLK} / 5)
- Configurable bit length of a transfer word from 4 to 16-bit
- Supports one transmit buffer and two receive buffers for data payload
- Supports MSB first or LSB first transfer sequence

- Supports Word Suspend function
- Supports GDMA transfer
- Supports 3-wire, no slave select signal, bi-direction interface
- Supports wake-up function by slave select signal in Slave mode

6.15 USCI – I²C Mode

6.15.1 Overview

On I²C bus, data is transferred between a Master and a Slave. Data bits transfer on the SCL and SDA lines are synchronously on a byte-by-byte basis. Each data byte is 8-bit. There is one SCL clock pulse for each data bit with the MSB being transmitted first, and an acknowledge bit follows each transferred byte. Each bit is sampled during the high period of SCL; therefore, the SDA line may be changed only during the low period of SCL and must be held stable during the high period of SCL. A transition on the SDA line while SCL is high is interpreted as a command (START or STOP). Please refer to Figure 6.15-1 for more detailed I²C BUS Timing.

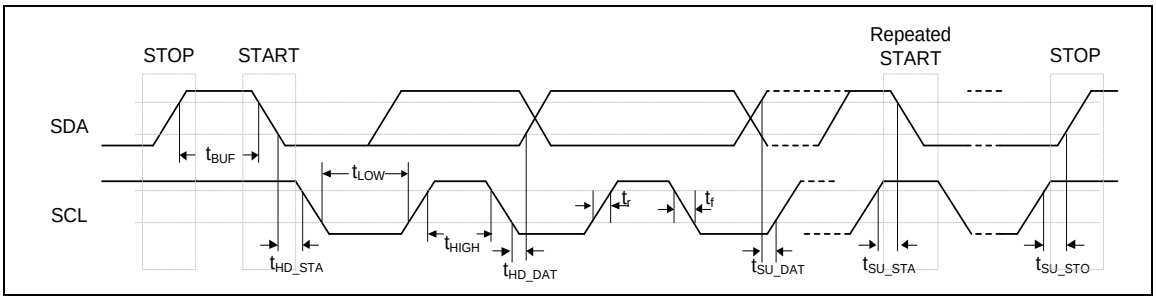

Figure 6.15-1 I²C Bus Timing

The device on-chip I²C provides the serial interface that meets the I²C bus standard mode specification. The I²C port handles byte transfers autonomously. The I²C mode is selected by FUNMODE (UI2C_CTL [2:0]) = 0100B. When this port is enabled, the USCI interfaces to the I²C bus via two pins: SDA and SCL. When I/O pins are used as I²C ports, user must set the pins function to I²C in advance.

Note: A pull-up resistor is needed for I²C operation because the SDA and SCL are set to open-drain pins when USCI is selected to I²C operation mode.

6.15.2 Features

- Full master and slave device capability
- Supports of 7-bit addressing, as well as 10-bit addressing
- Communication in standard mode (100 kBit/s) or in fast mode (up to 400 kBit/s)
- Supports multi-master bus
- Supports 10-bit bus time-out capability
- Supports Power down wake-up by data toggle or address match
- Supports setup/hold time programmable
- Supports GDMA transfer

6.16 Hardware Divider (HDIV)

6.16.1 Overview

The hardware divider (HDIV) is useful to the high performance application. The hardware divider is a signed, integer divider with both quotient and remainder outputs.

6.16.2 Features

- Signed (two's complement) integer calculation
- 32-bit dividend with 16-bit divisor calculation capacity
- 32-bit quotient and 32-bit remainder outputs (16-bit remainder with sign extends to 32-bit)
- Support 3 group of dividends, divisor, quotients and remainders for three times of independent calculation capacity
- Divided by zero warning flag
- 6 HCLK clocks taken for one cycle calculation
- Write divisor to trigger calculation
- Waiting for calculation ready automatically when reading quotient and remainder

6.17 Analog to Digital Converter (ADC)

6.17.1 Overview

The NM1240 contains one 12-bit successive approximation analog-to-digital converter (SAR A/D converter). The ADC has two sample-and-hold (S/H) which can be triggered by sorftware or hardware to sample two analog inputs simultaneously and does conversion in sequence..Each of SH0 and SH1 supports 16 voltage input channels which are from port pins, band-gap, temprature sensor, OP and DAC.

6.17.2 Features

- Analog input voltage range: 0~V_{DD}.
- 12-bit resolution and 10-bit accuracy guaranteed.
- Up to 16+16 single-end analog input channels.
- Each channel equips one result data register.
- Configurable ADC internal sampling time.

6.18 Analog Comparator and DAC (ACMP/DAC)

6.18.1 Overview

The NM1240 series contains one analog comparator. The comparator output is logic 1 when positive input greater than negative input, otherwise the output is 0. Each comparator can be configured to generate interrupt when the comparator output value changes.

6.18.2 Features

- Analog input voltage range: 0 ~ V_{DD}
- Supports Hysteresis function
- Optional internal reference voltage source for each comparator negative input

6.19 OP Amplifier

6.19.1 Overview

The NM1240 series contains a rail-to-rail OP amplifier (OP1) which can be enabled through the OP1EN bit.

6.19.2 Features

6.19.2.1 OP Features

- Supports analog input voltage range: 0~ V_{DD}.
- Rail-to-rail OP amplifier
- Supports OP1 output as inputs of ADC and ACMP

7 ELECTRICAL CHARACTERISTICS

For information on the NM1240 series electrical characteristics, please refer to NuMicro® NM1240 Series Datasheet.

7.1 Absolute Maximum Ratings

Symbol	Parameter	Min	Max	Unit
V_{DD}– V_{SS}	DC Power Supply	-0.3	+7.0	V
V_{IN}	Input Voltage	V_{SS} -0.3	V_{DD} +0.3	V
$1/t_{CLCL}$	Oscillator Frequency	-	24	MHz
T_A	Operating Temperature	-40	+105	℃
T_{ST}	Storage Temperature	-55	+150	℃
I_{DD}	Maximum Current into V_{DD}	-	120	mA
I_{SS}	Maximum Current out of V_{SS}	-	120	mA
I_{IO}	Maximum Current sunk by an I/O pin	-	35	mA
	Maximum Current sourced by an I/O pin	-	35	mA
	Maximum Current sunk by total I/O pins	-	300	mA
	Maximum Current sourced by total I/O pins	-	300	mA

Note: Exposure to conditions beyond those listed under absolute maximum ratings may adversely affects the life and reliability of the device.

7.2 DC Electrical Characteristics

(V_{DD} - V_{SS} = 2.2 ~ 5.5 V, T_A = 25°C)

Symbol	Parameter	Min	Typ	Max	Unit	Test Conditions			
V_{DD}	Operation voltage	2.2	-	5.5	V	V_{DD} = 2.2V ~ 5.5V up to 48 MHz V_{DD} = 3.0V ~ 5.5V up to 60 MHz			
V_{SS}	Power Ground	-0.3	-	-	V

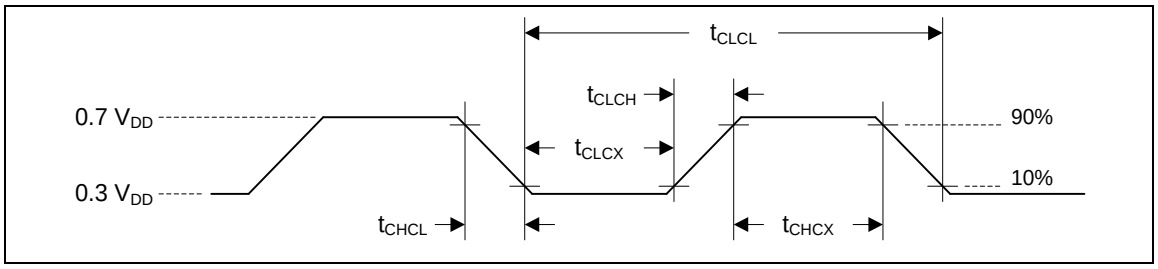
I_{SK13}		-	6	-	mA	V_{DD} = 2.2 V, V_{IN} = 0.4 V

Notes:

1. Only enable modules, which support 32 kHz EXT_CLK source
2. Only enable modules, which support 10 kHz LIRC clock source.
3. Guaranteed by design, not test in production.

7.3 AC Electrical Characteristics

7.3.1 External Input Clock



Note: Duty cycle is 50%.

Symbol	Parameter	Min	Typ	Max	Unit	Test Conditions
t_{CHCX}	Clock High Time	10	-	-	ns	-
t_{CLCX}	Clock Low Time	10	-	-	ns	-
t_{CLCH}	Clock Rise Time	2	-	15	ns	-
t_{CHCL}	Clock Fall Time	2	-	15	ns	-

7.3.2 External Clock Input (EXT_CLK) (up to 24MHz)

Symbol	Parameter	Min.	Typ.	Max	Unit	Test Conditions
V_{EXT_CLK}	Operation Voltage	2.2	-	5.5	V	-
T_A	Temperature	-40	-	105	℃	-
F_{EXT_CLK}	Clock Frequency	-	-	24	MHz	-

7.3.3 48/60 MHz Internal High Speed RC Oscillator (HIRC)

Symbol	Parameter	Min	Typ	Max	Unit	Test Conditions
V_{HRC}	Supply Voltage	-	1.5	-	V	-
f_{HRC60}	Center Frequency	-	60	-	MHz	-
	Calibrated Internal Oscillator Frequency	-1.0	-	+1.0	%	T_A = 25 ℃ V_{DD}=4.5 V~ 5.5 V
		-2.5	-	2.5	%	T_A = -40℃~105℃ V_{DD}=3.0 V~ 5.5 V
f_{HRC48}	Center Frequency	-	48	-	MHz	-
	Calibrated Internal Oscillator Frequency	-1.0	-	+1.0	%	T_A = 25 ℃ V_{DD} = 5.5 V

		-2.5	-	2.5	%	T_A = -40℃~105℃ V_{DD}=2.2 V~ 5.5 V

7.3.4 10 kHz Internal Low Speed RC Oscillator (LIRC)

Symbol	Parameter	Min	Typ	Max	Unit	Test Conditions
V_{LRC}	Supply Voltage	-	1.5V	-	V	-
f_{LRC}	Center Frequency	-	10	-	kHz	-
	Oscillator Frequency	-5[1]	-	+5[1]	%	V_{DD} = 2.2 V ~ 5.5 V T_A = -40℃ ~ +105℃

Note1: These parameters are characterized but not tested.

7.4 Analog Characteristics

7.4.1 12-bit SAR ADC

(V_{DD} – V_{SS} = 2.5 ~ 5.5 V ,T_A = -40~105°C)

Symbol	Parameter	Min	Typ	Max	Unit	Test Condition
-	Resolution	-	-	12	Bit	-
DNL	Differential Nonlinearity Error	-	2	-	LSB	V_{DD} = 3.0 ~5.5 V
INL	Integral Nonlinearity Error	-	±2	-	LSB	V_{DD} = 3.0 ~5.5 V
E_O	Offset Error	-	±1	-	LSB	V_{DD} = 3.0 ~5.5 V
E_G	Gain Error (Transfer Gain)	-	-1	-	LSB	V_{DD} = 3.0 ~5.5 V
E_A	Absolute Error	-	±3	-	LSB	V_{DD} = 3.0 ~5.5 V
-	Monotonic	Guaranteed			-	-
T_{ACQ}	Acquisition Time (Sample Stage)	N+1			$1/F_{ADC}$	V_{DD} = 3.0 ~5.5 V N is sampling counter, N=1~1024
		300			ns	V_{DD} = 3.0~5.5 V
T_{CONV}	Conversion Time[3]		800	1000	ns	V_{DD} = 3.0~5.5 V
I_{DDA}	Operation Current (Avg.)	-	1	-	mA	V_{DD} = 5.5 V
V_{IN}	Analog Input Voltage	0	-	V_{DD}	V	-
C_{IN}	Input Capacitance[2]	-	1.6	-	pF	-

Note:

1. ADC voltage reference is same with V_{DD} .
2. It's for sample and hold. The maximum value depends on process variation. Basically, the variation of C_{IN} is less than about 10% of typical value.
3. Guaranteed by design, not test in production. The conversion time is upto auto-completion of analog comparison in ADC IP and the typical value is about 800ns at V_{DD} = 5V.

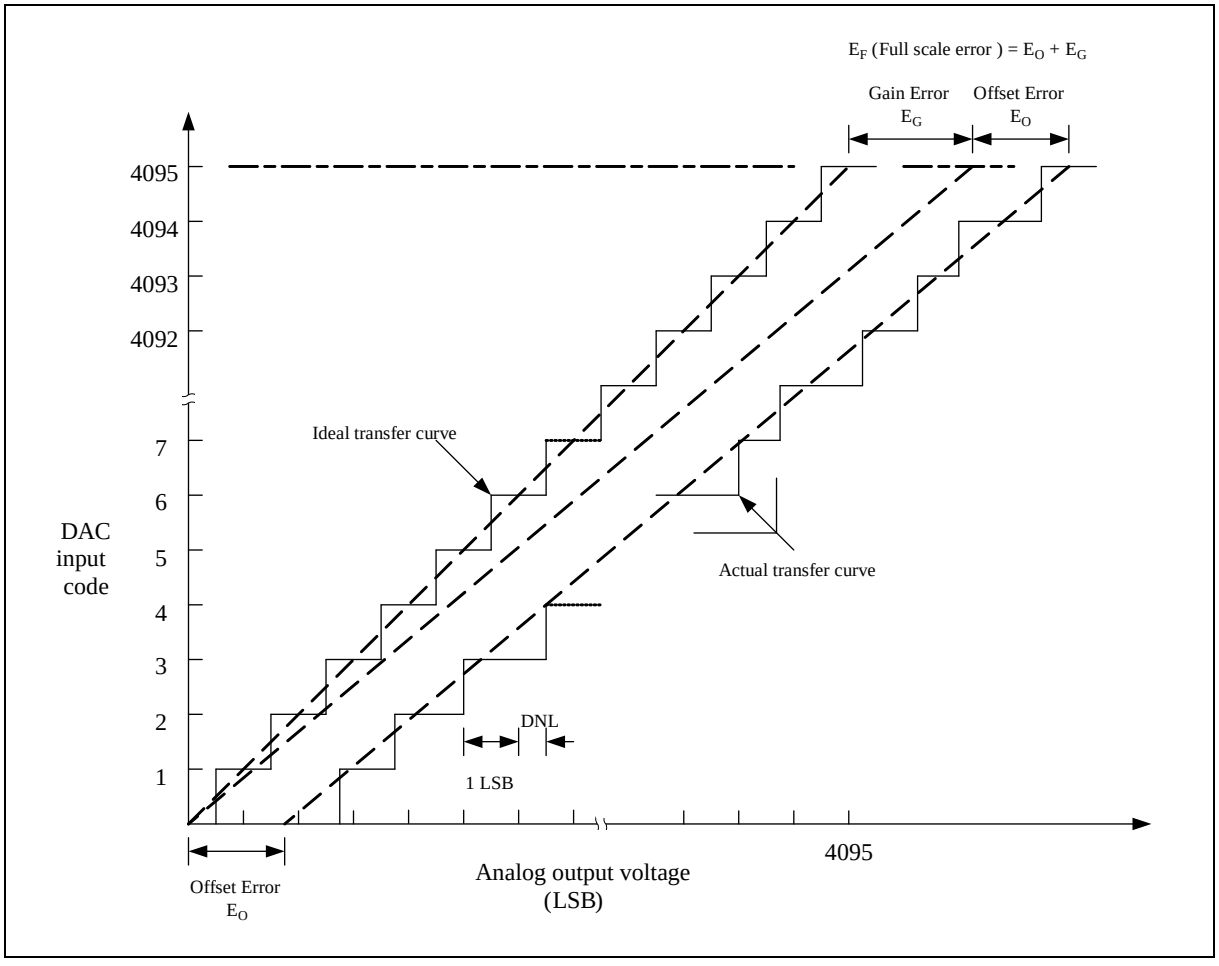
7.4.2 12-bit SAR DAC

(V_{DD} – V_{SS} = 2.5 ~ 5.5 V ,T_A = -40~105°C)

Symbol	Parameter	Min	Typ	Max	Unit	Test Condition
-	Resolution	-	-	12	Bit	-
DNL	Differential Nonlinearity Error	-	±4	-	LSB	V_{DD} = 5V
INL	Integral Nonlinearity Error	-	±3	-	LSB	V_{DD} = 5V
E_O	Offset Error	-	3	-	LSB	V_{DD} = 5V
E_G	Gain Error (Transfer Gain)	-	3	-	LSB	V_{DD} = 5V
I_{DDA}	Operation Current (Avg.)	-	100	-	uA	V_{DD} = 5V
V_{out}	Analog output Voltage	0	-	V_{DD}	V	-

Note:

1. DAC voltage reference is the same with V_{DD}.



7.4.3 DAC Output buffer

(V_{DD} – V_{SS} = 2.5 ~ 5.5 V ,T_A = -40~105°C)

Parameter	Min	Typ	Max	Unit	Test Condition
Input offset voltage	-	2	5	mV	
Output swing	0.1	-	VDD-0.1	V	
Input common mode range	0.1	-	VDD-0.1	V	
DC gain	-	80	-	dB	
Slew rate	3.0	-	-	V/us	V_{DD} = 5V, RLOAD = 33K, CLOAD = 50p
Output Current		3		mA	V_{DD} - 0.3 ~ V_{SS} + 0.3, V_{DD} = 3~5V
Power consumption		200		uA	V_{DD} = 5V

7.4.4 LDO & Power Management

(V_{DD} – V_{SS} = 2.2 ~ 5.5 V ,T_A = -40~105°C)

Symbol	Parameter	Min	Typ	Max	Unit	Test Condition
V_{LDO}	Output Voltage	1.35	1.5	1.65	V	-

Notes:

It is recommended a 0.1μF bypass capacitor is connected between V_{DD} and the closest V_{SS} pin of the device.

7.4.5 Brown-out Detector

(V_{DD} – V_{SS} = 0 ~ 5.5 V ,T_A = -40~105°C)

Symbol	Parameter	Min	Typ	Max	Unit	Test Condition
V_{BOD}	Brown-out Hysteresis	30	100	150	mV	
V_{BOD}	Brown-out Detector	4.15	4.3	4.45	V	BOV_VL [2:0] = 7
		3.85	4.0	4.15	V	BOV_VL [2:0] = 6
		3.55	3.7	3.85	V	BOV_VL [2:0] = 5
		2.85	3.0	3.15	V	BOV_VL [2:0] = 4
		2.55	2.7	2.85	V	BOV_VL [2:0] = 3
		2.3	2.4	2.5	V	BOV_VL [2:0] = 2
		2.1	2.2	2.3	V	BOV_VL [2:0] = 1
		1.9	2.0	2.1	V	BOV_VL [2:0] = 0

7.4.6 Power-on Reset

(V_{DD} – V_{SS} = 0 ~ 5.5 V, T_A = -40~105°C)

Symbol	Parameter	Min	Typ	Max	Unit	Test Condition
V_{POR}	Threshold Voltage	1.60	1.75	1.90	V	-
V_{LVRLPM}	Threshold Voltage(Low Power)	1.3	1.6	2.1	V	-

7.4.7 LVR Reset

(V_{DD} – V_{SS} = 0 ~ 5.5 V, T_A = -40~105°C)

Symbol	Parameter	Min	Typ	Max	Unit	Test Condition
V_{LVR}	Threshold Voltage(high→low)	1.7	1.9	2.1	V	-
V_{LVRHYS}	Hysteresis Voltage	-	-	100	mV	

7.4.8 Comparator

(V_{DD} – V_{SS} = 2.2 ~ 5.5 V, T_A = -40~105°C)

Symbol	Parameter	Min	Typ	Max	Unit	Test Condition
V_{OFF}	Input Offset Voltage		±10		mV	-
V_{SW}	Output Swing	0	-	V_{DD}	V	-
V_{COM}	Input Common Mode Range	0.1	-	V_{DD} – 0.1	V	-
-	DC Gain[1]	-	60	-	dB	-
T_{PGD}	Propagation Delay	-	200	-	ns	
V_{HYS}	Hysteresis	10	20	30	mV	ACMPHYSEN = 01
V_{HYS}	Hysteresis	60	90	120	mV	ACMPHYSEN = 10
V_{HYS}	Hysteresis	95	150	200	mV	ACMPHYSEN = 11
T_{STB}	Stable time	-	1.06	-	µs	

Notes:

Guaranteed by design, not test in production.

7.4.9 OP Amplifier

(V_{DD} - V_{SS} = 2.2 ~ 5.5 V ,T_A = -40~105°C)

Parameter	Min	Typ	Max	Unit	Test Condition
Input offset voltage	-	2	5	mV	
Output swing	0.1	-	VDD-0.1	V	
Input common mode range	0.1	-	VDD-0.1	V	
DC gain	-	80	-	dB	
PSRR+	-	90	-	dB	VDD=5V
CMRR	-	90	-	dB	VDD=5V
Slew rate	6.0	-	-	V/us	VDD=5V, RLOAD=33K, CLOAD=50p
Wake up time	-	-	1	us	
Maximum output voltage swing from rail		20		mV	V_{DD} =5.5, RL=10K
		100		mV	V_{DD} =5.5, RL=2K
Open-loop output implement		200		ohm	V_{DD} =5, f=10MHz
Close-loop output implement		95		ohm	V_{DD} =5, f=10MHz

7.4.10 Temperature Sensor

(V_{DD} - V_{SS} = 2.2 ~ 5.5 V ,T_A = -40~105°C)

Symbol	Parameter	Min	Typ	Max	Unit	Test Condition
TA	Temperature	-40	-	105	℃	
-	Gain [1],	-	-1.81	-	mV/℃	
-	Offset [1,2]	-	715	-	mV	TA = 0 ℃

Note:

1. The temperature sensor formula for the output voltage (Vtemp) is list as below equation.
   Vtemp (mV) = Gain (mV/℃) x Temperature (℃) + Offset (mV)
2. The Gain and Offset may have some drift for different chips. Register SYS_TSOFFSET is a reference data measured by ADC in factory test.

7.4.11 ESD Characteristics

Symbol	Ratings	Condition	Package	Maximum Value	Unit
V_{ESD}	Electrostatic discharge (Human body mode)	TA = + 25 ℃	LQFP 48	8000	V
	Electrostatic discharge (Charged Device mode)			500	V

7.4.12 EFT Characteristics

Symbol	Condition	Package	Pass Level	Unit
	Fsys			
	HIRC	LQFP 48	+/- 4000	V

7.5 Flash DC Electrical Characteristics

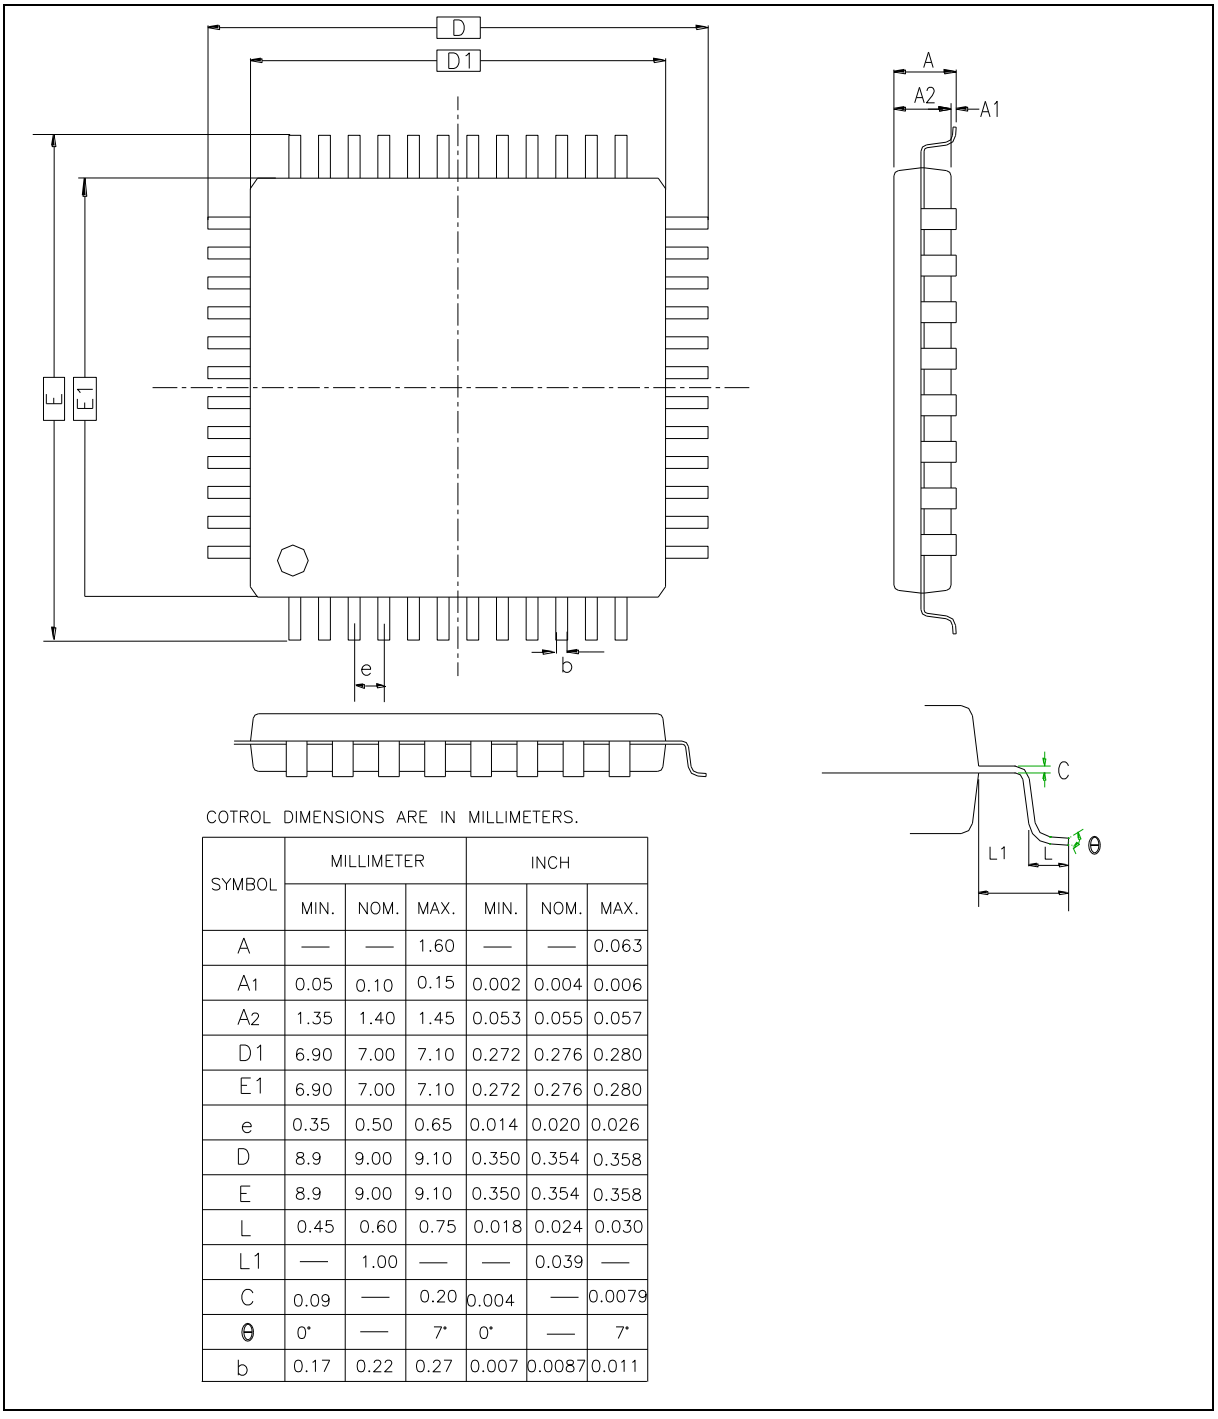
Symbol	Parameter	Min	Typ	Max	Unit	Test Condition
V_{FLA}[2]	Supply Voltage	1.35	1.5	1.65	V	
N_{ENDUR}	Endurance	20,000	-	-	cycles[1]	
T_{RET}	Data Retention	10	-	-	year	T_A =85℃
T_{ERASE}	Sector Erase Time	-		5	ms	
T_{PROG}	Program Time	-	5	6.5	us	Per Byte
I_{DD1}	Read Current	-	4	5.5	mA	@50MHz
I_{DD2}	Program Current	-	-	3.5	mA	
I_{DD3}	Erase Current	-	-	2	mA	

Notes:

1. Number of program/erase cycles.
2. V_{FLA} is source from chip LDO output voltage.
   Guaranteed by design, not test in production.

8 PACKAGE DIMENSIONS

8.1 48-Pin LQFP (7mm x 7mm)



COTROL DIMENSIONS ARE IN MILLIMETERS.

9 REVISION HISTORY

Date	Revision	Description
2020.06.30	0.1	Preliminary version
2020.07.22	0.1	Add a note “To be defined by the final test” in 7.4.1 Modify LQFP-48 pin1 as NC
2020.09.03	0.1	1. Modify GDMA in Features 2. Modify the Selection Guide 3. Modify the Electrical Characteristics
2020.09.28	0.1	1. Correct the 1000ns to 800ns in the note of section 7.4.1 12-bit SAR ADC
2020.12.08	0.1	1. Remove the parts of NM1243 series 2. Correct the typo from 16.8uS to 50.6uS in Figure 6.2-1 System Reset Resources 3. Update the Figure 6.2-4 Low Voltage Reset (LVR) Waveform
2021.03.10	0.1	1. Modify the ADC block diagram
2021.12.02	0.1	1. Update the ESD and EFT characteristics
2022.01.21	0.1	1. Update the section of 4.3.1 NM1240 Series Pin Description Overview
2022.07.06	0.1	1. Remove “two receive buffer” from I2C feature list
2022.07.21	0.2	1. Remove the “Preliminary” from the document 2. Update the version to Rev.0.2.
2022.09.12	0.2	1. Modify the table content in 4.3.1 NM1240 Series Pin Description Overview 2. Modify the V_{BG} Typical value in Chapter 7.2.
2022.11.08	0.2	1. Add compliance statement of International Environmental Regulations.
