

Features

- Constant-Voltage (CV) and Constant-current (CC) Control without Secondary-feedback Circuitry
- Green Mode PWM Frequency Linearly Decreasing
- Fixed PWM Frequency at 42kHz with Frequency Hopping to Solve EMI Problem
- Low Startup Current: 10µA
- Low Operating Current: 3.5mA
- . Peak-Current-Mode Control in CV Mode
- . Cycle-by-Cycle Current Limiting
- V_{DD} Over-Voltage Protection with Auto-Restart
- -V_{DD} Under-Voltage Lockout (UVLO)
- Gate Output Maximum Voltage Clamped at 18V
- Fixed Over-temperature Protection with Latch
- SOP-8 Package Available

AN-6067 Design Guide for FAN100/102/FSEZ1016A/1216

Description

This highly integrated PWM controller, FAN100, provides several features to enhance the performance of low-power flyback converters. The proprietary topology enables simplified circuit design for battery charger applications. A low-cost, smaller, and lighter charger results when compared to a conventional design or a linear transformer. The startup current is only 10µA, which allows use of large startup resistance for further power saving.

To minimize the standby power consumption, the proprietary green-mode function provides off-time modulation to linearly decrease PWM frequency under light-load conditions. This green-mode function assists the power supply meeting the power conservation requirements.

Using FAN100, a charger can be implemented with fewest external components and minimized cost. A typical output CV/CC characteristic envelope is shown in Figure 1.

FAN100 controller is available in an 8-pin SOP package.

Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

Symbol	Parameter	Min.	Max.	Unit
V _{VDD}	DC Supply Voltage ^(1,2)		30	V
V _{VS}	VS Pin Input Voltage	-0.3	7.0	V
V _{CS}	CS Pin Input Voltage	-0.3	7.0	V
V _{COMV}	Voltage Error Amplifier Output Voltage	-0.3	7.0	V
V _{COMI}	Voltage Error Amplifier Output Voltage	-0.3	7.0	V
PD	Power Dissipation ($T_A < 50^{\circ}C$)		660	mW
Θ_{JA}	Thermal Resistance (Junction-to-Air)		150	°C /W
Θ _{JC}	Thermal Resistance (Junction-to-Case)		39	°C /W
TJ	Operating Junction Temperature		+150	°C
T _{STG}	Storage Temperature Range	-55	+150	°C
TL	Lead Temperature (Wave Soldering or IR, 10 Seconds)		+260	°C
ESD	Electrostatic Capability, Human Body Model, JEDEC: JESD22-A114		4.5	KV
EOD	Electrostatic Capability, Charged Device Model, JEDEC: JESD22-C101		2000	V

Notes:

1. Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device.

2. All voltage values, except differential voltages, are given with respect to GND pin.

Recommended Operating Conditions

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended www.DataSloperating conditions are specified to ensure optimal performance to the datasheet specifications. Fairchild does not recommend exceeding them or designing to Absolute Maximum Ratings.

Functional Description

The proprietary topology of FAN100 enables simplified circuit design for battery charger applications. Without secondary feedback circuitry, the CV and CC control are achieved accurately. As shown in Figure 23, with the frequency-hopping PWM operation, EMI problems can be solved by using minimized filter components. FAN100 also provides many protection functions. The VDD pin is equipped with over-voltage protection and with under-voltage lockout. Pulse-by-pulse current limiting and CC control ensure over-current protection at heavy loads. The GATE output is clamped at 15V to protect the external MOSFET from over-voltage damage. Internal over-temperature-protection function shuts down the controller with latch when over-heated.

Startup Current

The startup current is 10µA. Low startup current allows a startup resistor with a high resistance and a lowwattage to supply the startup power for the controller. A 1.5M Ω , 0.25W, startup resistor and a 10µF/25V V_{DD} hold-up capacitor are sufficient for an AC-to-DC power www.DataStadapter with a wide input range (100V_{AC} to 240V_{AC})

Operating Current

The operating current has been reduced to 3.5mA. The low operating current results in higher efficiency and reduces the V_{DD} hold-up capacitance requirement. Once FAN100 enters "deep" green mode, the operating current is reduced to 1.2mA, which assists the power supply meeting power conservation requirements.

Green Mode Operation

Figure 24 shows the characteristics of the PWM frequency vs. the output voltage of the error amplifier (V_{COMV}). The FAN100 uses the positive, proportional, output load parameter (V_{COMV}) as an indication of the output load for modulating the PWM frequency. In heavy load conditions, the PWM frequency is fixed at 42KHz. Once V_{COMV} is lower than V_N, the PWM frequency starts to linearly decrease from 42KHz to 550Hz, providing

further power savings and meeting international power conservation requirements.

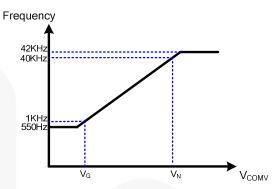

Figure 24. Green Mode Frequency vs. V_{COMV}

Constant Voltage (CV) and Constant Current (CC) Operation

An innovative technique allows the FAN100 to accurately achieve CV/CC characteristic output without secondary side voltage or current-feedback circuitry. A feedback signal for CV/CC operation from the reflected voltage across the primary auxiliary winding is proportional to secondary winding, so it provides the controller the feedback signal from the secondary side and achieves constant voltage output property. In constant-current-output operation, this voltage signal is detected and examined by the precise constant current regulation controller, which then determines the on-time of the MOSFET to control input power and provide constant current output property. With feedback voltage V_{CS} across current-sense resistor, the controller can obtain input power of power supply. Therefore, the region of constant current output operation can be adjusted by the current-sense resistor.

Temperature Compensation

Built-in temperature compensation provides better constant voltage regulation at different ambient temperatures. This internal compensation current is a positive temperature coefficient (PTC) current that can compensate the forward-voltage drop of the secondary diode of varying with temperature. This variation causes output voltage rising at high temperature.

Leading-Edge Blanking (LEB)

Each time the power MOSFET is switched on, a turn-on spike occurs at the sense resistor. To avoid premature termination of the switching pulse, a leading-edge blanking time is built in. Conventional RC filtering can be omitted. During this blanking period, the current-limit comparator is disabled and cannot switch off the gate driver.

Under-Voltage Lockout (UVLO)

The turn-on and turn-off thresholds are fixed internally at 16V and 5V. During start-up, the hold-up capacitor must be charged to 16V through the startup resistor to enable the FAN100. The hold-up capacitor continues to supply V_{DD} until power can be delivered from the auxiliary winding of the main transformer. V_{DD} must not drop below 5V during this startup process. This UVLO hysteresis window ensures that hold-up capacitor is adequate to supply V_{DD} during start-up.

V_{DD} Over-Voltage Protection (OVP)

 V_{DD} over-voltage protection prevents damage due to over-voltage conditions. When the voltage V_{DD} exceeds 28V due to abnormal conditions, PWM pulses are disabled until the V_{DD} voltage drops below the UVLO, then starts up again. Over-voltage conditions are usually caused by open feedback loops.

Over-Temperature Protection (OTP)

The built-in temperature-sensing circuit to shut down PWM output once the junction temperature exceeds gradually drops to the UVLO voltage. Some of the FAN100's internal circuits are shut down and V_{DD} gradually starts increasing again. When V_{DD} reaches 16V, all the internal circuits, including the temperature sensing circuit, start operating normally. If the junction temperature is still higher than 140°C, the PWM controller shuts down immediately. This situation continues until the temperature drops below 110°C.

Gate Output

The BiCMOS output stage is a fast totem pole gate driver. Cross conduction has been avoided to minimize heat dissipation, increase efficiency, and enhance reliability. The output driver is clamped by an internal 15V Zener diode to protect power MOSFET transistors against undesired over-voltage gate signals.

Built-in Slope Compensation

The sensed voltage across the current-sense resistor is used for current-mode control and pulse-by-pulse current limiting. Built-in slope compensation improves stability and prevents sub-harmonic oscillations due to peak-current mode control. The FAN100 has a synchronized, positively-sloped ramp built-in at each switching cycle.

Noise Immunity

Noise from the current sense or the control signal can cause significant pulse-width jitter, particularly in continuous-conduction mode. While slope compensation helps alleviate these problems, further precautions should still be taken. Good placement and layout practices should be followed. Avoiding long PCB traces and component leads, locating compensation and filter components near the FAN100, and increasing the power MOS gate resistance are advised.
