

## 10941 and 10939 Alphanumeric and Bargraph Display Controller

### DESCRIPTION

The Rockwell 10939 and 10941 Alphanumeric and Bargraph Display Controller is a two-chip MOS/LSI general purpose display controller system designed to interface with bargraph and segmented displays (vacuum-fluorescent or LED).

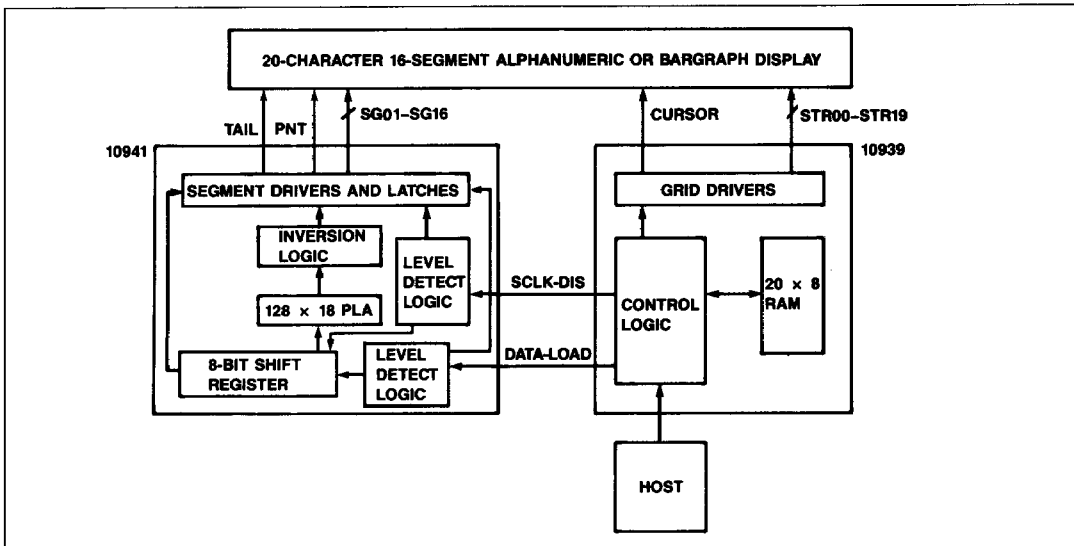

The two-chip set will drive displays with up to 16 segments (plus decimal point and comma tail) and up to 20 grids (characters) plus a cursor. The chips can be cascaded to drive larger displays of 80 characters. Segment decoding for ASCII characters and bargraph patterns is accomplished through an internal PLA.

### ORDERING INFORMATION

Part Number	Package Type	Temperature Range (°C)
10941P	Plastic	0 to +70
10941PE	Plastic	-40 to +85
10939P	Plastic	0 to +70
10939PE	Plastic	-40 to +85

### FEATURES

- 20-character display driver cascadable to 80 characters
- Direct drive capability for vacuum-fluorescent displays
- 128 x 18 PLA provides segment decoding for ASCII characters (all caps only) and bargraph patterns
- Serial or parallel data input for 8-bit display and control characters
- Brightness, refresh rate, and display mode controls
- Separate cursor driver output
- 10939—40-pin DIP package
- 10941—24-pin DIP package

Block Diagram of 10941 and 10939

INTERFACE DESCRIPTION

10941 Pin Functions

Signal Name	Pin No.	Function
V <sub>SS</sub>	2	Power and signal reference
SG01-SG16	6-15, 17-22	Segment driver outputs
SCLK-DIS	23	Serial data shift clock
DATA-LOAD	24	Serial data output/latch control
PNT	4	Decimal Point driver output
TAIL	5	Comma Tail driver output
V <sub>DD</sub>	1	DC Power
V <sub>GG</sub>	16	Display voltage

10941 Pin Configuration

10939 Pin Functions

Signal Name	Pin No.	Function
V <sub>SS</sub>	36	Power and signal reference
V <sub>DD</sub>	37	DC Power
CLOCK	38	Synchronization Clock
CURSOR	14	Cursor driver output
MASTER	39	Master/Slave Mode control
SIP	3	Sync Input
SOP	2	Sync Output
D0-D7	6-13	Serial or parallel data input
LD	5	Input data strobe
POR	4	Power-on reset
SCLK-DIS	1	Serial data shift clock
DATA-LOAD	40	Serial data output/latch control
STR00-STR19	15-34	Grid Driver Outputs
V <sub>GG</sub>	35	Display voltage

10939 Pin Configuration

SPECIFICATIONS

ABSOLUTE MAXIMUM RATINGS\*

Voltages are referenced to V<sub>SS</sub>

Parameter	Symbol	Value	Unit
Operating Temperature	T <sub>c</sub>	0 to +70	°C
		-40 to +85	°C
		-55 to +125	°C
Storage Temperature	T <sub>i</sub>	-55 to +125	°C
Operating Voltage	V <sub>DD</sub>	-22 to -18 -20 (typical)	Vdc
Operating Display Voltage	V <sub>GG</sub>	-50	Vdc

\*NOTE: Stresses above those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in other sections of this document is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## DC CHARACTERISTICS

All voltages referenced to  $V_{SS}$ 

Parameter	Symbol	Min	Typ	Max	Unit
10941 Output Segments Logic "1" ( $I_{load} = 2 \text{ mA}$ ) Logic "1" ( $I_{LOAD} = 0 \text{ mA}$ )	$V_{OH}$ $V_{OL}$	-1.5 $V_{GG}$		$V_{SS}$ $0.95 \times V_{GG}$	V V

## OPERATING CURRENTS

Parameter	Notes	Maximum		Typical	Unit
		Industrial TA = -40°C $V_{DD} = -22 \text{ Vdc}$ $V_{GG} = -50 \text{ Vdc}$	Commercial TA = 0°C $V_{DD} = -22 \text{ Vdc}$ $V_{GG} = -50 \text{ Vdc}$	TA = 25°C $V_{DD} = -20 \text{ Vdc}$ $V_{GG} = -50 \text{ Vdc}$	
10941 $I_{DD}$ $I_{GG}$	1	4.5 5.7	3.6 4.6	3.2 4.1	mA mA
10939 (master) $I_{DD}$ $I_{GG}$	2	13.6 1.0	10.9 0.8	6.0 0.5	mA mA
10939 (slave) $I_{DD}$ $I_{GG}$	2	9.1 1.0	7.3 0.8	4.0 0.5	mA mA
<b>Notes:</b> 1. The 10941 has 18 internal drivers which are brought out. $I_{GG}$ is proportional to the number of drivers on. The values given are for all 18 drivers on. Divide $I_{GG}$ shown by 18 to determine $I_{GG}$ for one driver. 2. The 10939 will never have more than two drivers on at any one time; one grid driver and the cursor. The values shown are for two drivers on with 100% duty cycle.					

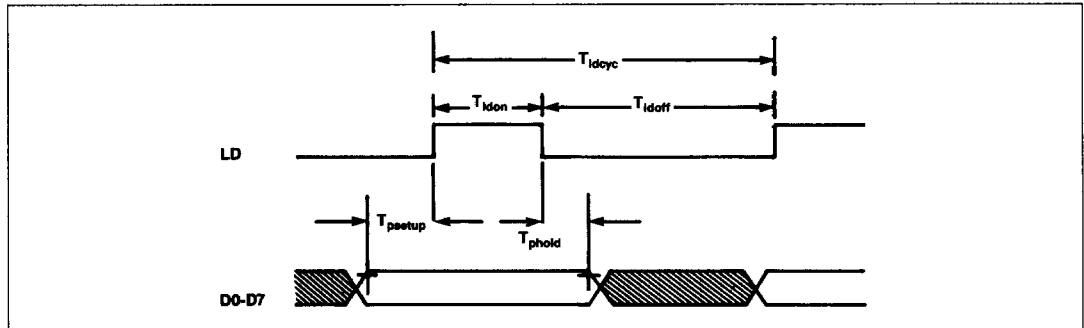

AC CHARACTERISTICS

Parallel Interface Timing Waveforms

## FUNCTIONAL DESCRIPTION

Once the display buffer has been loaded from the host processor, the 10941/10939 system generates all timing signals required to control the display.

Input data is loaded into the Display Data Buffer as a series of 8-bit words via the Serial or Parallel Data Input channel on the 10939. Internal timing and control logic synchronize the digit output signals with the Serial Data and Load signals to the 10941 to provide the proper timing for the multiplexing operation. A  $128 \times 18$  bit PLA is provided for decoding the character set and bargraph codes.

The parallel data input mode is implemented by toggling any of data lines D2–D7 after POR has gone low. Once the parallel data load mode has been implemented, a power-on reset procedure must be performed to return to serial data load mode. Parallel data transfer is accomplished by putting the command or display data on the data lines, then pulsing the LD line. The load cycle time must be at least  $60 \mu\text{s}$  with the LD line set high for at least one  $\mu\text{s}$  and held low for at least  $40 \mu\text{s}$ .

The serial data input mode is implemented during the power-on reset procedure. In those systems using serial mode, ports D2–D7 should be tied low to prevent the inadvertent implementation of the parallel load mode. Serial data bytes are shifted into a data buffer MSB first on line D0 using line D1 as the serial clock. The last eight bits clocked in are latched into the display controller by a pulse on the LD line. The cycle time for each data bit is  $2 \mu\text{s}$  and the load time for each byte is  $60 \mu\text{s}$ .

Input data may be Control or Display data. The following paragraphs describe the format and functions of these control and display data words.

### CONTROL DATA WORDS

Control data words are used to select the operating parameters of the display controller. They must be preceded by a Control Prefix word (0000 0001, hexadecimal 01) to be distinguished from Display Data words. Table 1 shows the Control Word code assignments and functions.

### Buffer Pointer Control

The Buffer Pointer Control code sets the Display Data Buffer pointer. The lower 5 bits of the code are loaded into the buffer pointer (see Table 2).

Table 1. Control Word Assignments

Hex Value	Function
00	Not used
01	Load 01 into Data Buffer
02	Not used
03	Not used
04	Not used
05	Set digit time to 16 cycles per grid
06	Set digit time to 32 cycles per grid
07	Set digit time to 64 cycles per grid
08	Enable Normal Display Mode (MSB in data words is cursor control only)
09	Enable Blank Mode (data words with MSB = 1 will be blanked and cursor will be on)
0A	Enable Inverse Mode (data words with MSB = 1 will be "inversed" and cursor will be on)
0B	Not used
0C	Not used
0D	Not used
0E	Start Display Refresh Cycle (use only once after reset)
0F	Not used
10–3F	Not used
40–7F	Load Duty Cycle Register with lower 6 bits (0–63)
80–9F	Load Digit Counter (80 = 32, 81 = 1, 82 = 2, etc.)
A0–BF	Not used
C0–DF	Load Buffer Pointer Register with lower 5 bits
E0–FF	Not used

Table 2. Buffer Pointer Control Codes

Code Value	Pointer Value	Character Position
C0	00	0
C1	01	1
C2	02	2

D1	11	17
D2	12	18
D3	13	19

**Note:**  
DO NOT USE CHARACTER POSITIONS 20–31 (Codes D4–DF).

### Digit Counter Control

The Digit Counter Control code defines the number of character positions (grids) to be controlled. This code is normally used only during initialization routines, but it may also be used in conjunction with the Load Duty Cycle control code to extend the range of brightness control (see Table 3).

### Duty Cycle Control

The Duty Cycle Control code turns the display on and off, adjusts display brightness, or modifies display timing. The time slot for each character is 16, 32, or 64 cycles as selected by the Digit Time Control codes (see Table 1). The segment and digit drivers for each character are on for a maximum of 13, 29, or 61 cycles with a 3 cycle inter-digit off-time. The lower 6 bits of the Duty Cycle Control code are loaded into the Duty Cycle Register. Resultant duty cycles are shown in Table 4.

### Digit Time Select

The Digit Time Select code sets the total time for each character during the refresh cycle. Three values can be set using the three codes shown in Table 1. The default value set at power-on is 64 cycles per grid. For displays with 40 or more characters, or under conditions where the display can be subjected to quick movements during viewing (e.g. portable or vehicle-mounted applications), it may be necessary to increase the refresh rate by selecting 16 or 32 cycles per grid with the appropriate control code.

Table 3. Digit Counter Control Codes

Code	Digit Counter Value	No. of Grids Controlled
80	00	32
81	01	1
82	02	2
83	03	3
84	04	4
85	05	5

7E	13	3	29	3	60	4
7F	13	3	29	3	61	3

significant) bit controls the cursor (see Cursor Control). This bit is known as the data byte control bit. If either Blank or Inverse mode is selected, a "0" in this bit causes a normal character display, while a "1" selects either Blank or Inverse mode, depending on which mode is enabled. Three control codes are provided (see Table 1) to enable Blank Mode, Inverse Mode, or Normal Display mode.

In the Blank mode, any character with the MSB = "1" will be blanked. In the Inverse mode, it will be displayed with all segment driver outputs inverted. On video displays, this is referred to as "Inverse Video" format. These controls allow individual characters or groups of characters to be blinked or blanked by simply changing the mode without changing the data in the Display Buffer.

### Cursor Control

The data byte control bit (MSB 8), besides selecting Blank, Inverse, or Normal mode, also controls the cursor output which is enabled on all characters with the MSB equal to one. Therefore, when the Normal mode is enabled and the MSB of the data byte is set to a one, the normal character is displayed with the cursor on. When the Blank mode is enabled and the MSB is set to a one, the character is blanked but the cursor is on. If Inverse mode is enabled and the MSB is set to a one, the inverse character is displayed and the cursor is on but not inverted.

**Start Refresh**

At power on, the 10939 is held in an internal halt mode. The normal display refresh sequence starts upon receipt of a Start Refresh control code. This is particularly useful for synchronizing systems using more than one 10939. Only the Master 10939 in a multi-chip system will recognize the Start Refresh code. The Master starts the Slave(s) at the appropriate time, using the SOP signal.

**INPUT DISPLAY DATA WORDS**

Display data words are loaded as 8-bit codes. The eighth (most significant) bit specifies normal (0) or blank/inverse (1) display mode, depending on the blank/inverse mode selection (see Control data words 09 and 0A in Table 1). This bit also controls the cursor.

Twenty display data words must be entered to completely load the Display Data Buffer. The Buffer Pointer automatically increments after each data word is stored in the buffer. To select a character position to be loaded out of sequence, use the Buffer Pointer control code. The Buffer Pointer will automatically reset to character position 0 when its value is equal to the programmed Digit Count.

**POWER-ON RESET**

The Power-On Reset (POR) initializes the internal circuits of the 10939. This is normally accomplished when power ( $V_{DD}$ ) is applied. The following conditions are established by application of POR:

- a. The Grid Drivers (STR00–STR19) on the 10939 are in the off state.
- b. The Segment Drivers (SG01–SG16) on the 10941 are in the off state.
- c. The Duty Cycle is set to 0.
- d. The Digit Counter is set to 32.
- e. The Buffer Pointer is set to 0.
- f. The Digit time is set to 64.
- g. The Normal display mode is set.
- h. DATA-LOAD is set to high impedance state.
- i. SCLK-DIS is set to  $V_{OL}$  to disable the anode drivers in the 10941.
- j. SOP is set to  $V_{OL}$  to disable the sync pulse.

**Note:**

- 1. When the POR signal is removed, SCLK-DIS is set to the high impedance state.
- 2. During the initial rise time of  $V_{DD}$  at power turn-on, the magnitude of  $V_{GG}$  should not exceed the magnitude of  $V_{DD}$ .

**DIGIT (GRID) DRIVERS (STR00–STR19) PLUS CURSOR**

The 20 Digit (Grid) Drivers select each of the display character positions sequentially during a refresh scan. Display segments are illuminated when both the Digit Drivers and Segment Drivers for a particular character are energized simultaneously. The Cursor segment is generated by the 10939, but its timing characteristics are identical to the 16 segments generated by the 10941.

**SEGMENT (ANODE) DRIVERS (SG01–SG16, PNT, TAIL)**

Eighteen Segment (Anode) Drivers are provided in the 10941. The output states for each character pattern and each bargraph pattern are internally decoded from the 8-bit characters received from the 10939 by means of a  $128 \times 18$ -bit PLA. Data codes and the corresponding segment patterns are shown in Figure 1. Data codes and the corresponding bargraph patterns are shown in Figure 2.
