

Single channel high-side driver with current sense analog feedback for automotive applications

PowerSSO-16

Product status link

[VN9012AJ](#)

Product summary

Order code	VN9012AJTR
Package	PowerSSO-16
Packing	Tape and reel

Features

Max. transient supply voltage	V_{CC}	36 V
Operating voltage range	V_{CC}	4 to 28 V
Typ. on-state resistance (per channel)	R_{ON}	12 m Ω
Current limitation (typ.)	I_{LIMH}	63 A
Standby current (max.)	I_{STBY}	0.5 μ A

- AEC-Q100 qualified
- Extreme low voltage operation for deep cold cranking applications (compliant with LV124, revision 2013)
- General
 - Single channel smart high-side driver with current sense analog feedback
 - Very low standby current
 - Compatible with 3 V and 5 V CMOS outputs
- Current sense diagnostic functions
 - Multiplexed analog feedback of load current with high precision proportional current mirror
 - Overload and short to ground (power limitation) indication
 - Thermal shutdown indication
 - OFF-state open-load detection (with external pull-up)
 - Output short to V_{CC} detection
 - Sense enable/disable
- Protections
 - Undervoltage shutdown
 - Overvoltage clamp
 - Load current limitation
 - Self limiting of fast thermal transients
 - Configurable latch-off on overtemperature or power limitation with dedicated fault reset pin
 - Loss of ground and loss of V_{CC}
 - Reverse battery through self turn-on
 - Electrostatic discharge protection

Applications

- Automotive resistive, inductive and capacitive loads
- Protected supply for ADAS systems: radars and sensors

Description

The VN9012AJ is a single channel high-side driver manufactured using ST proprietary VIPower M0-9 technology and housed in a PowerSSO-16 package. The device is designed to drive 12 V automotive grounded loads through a 3 V and 5 V CMOS-compatible interface, providing protection and diagnostics.

The device integrates advanced protective functions such as load current limitation, overload active management by power limitation and overtemperature shutdown with configurable latch-off.

A $\overline{\text{FaultRST}}$ pin unlatches the output in case of fault or disables the latch-off functionality.

A dedicated multifunction multiplexed analog output pin delivers sophisticated diagnostic functions including high precision proportional load current sense, supply voltage feedback and chip temperature sense, in addition to the detection of overload and short circuit to ground, short to V_{CC} and OFF-state open-load.

1 Block diagram and pin description

Figure 1. Block diagram

Table 1. Pin functions

Name	Function
V _{CC}	Battery connection.
OUTPUT ₀	Power outputs.
GND	Ground connection. Must be reverse battery protected by an external diode / resistor network.
INPUT ₀	Voltage controlled input pin with hysteresis, compatible with 3 V and 5 V CMOS outputs. It controls output switch state.
CS	Multiplexed analog sense output pin; it delivers a current proportional to the selected load current.
SEn	Active high compatible with 3 V and 5 V CMOS outputs pin; it enables the CS diagnostic pin.
FaultRST	Active low compatible with 3 V and 5 V CMOS outputs pin; it unlatches the output in case of fault; If kept low, sets the outputs in auto-restart mode.

Table 2. Suggested connections for unused and not connected pins

Connection/pin	CS	NC	Output	Input	SEn, $\overline{\text{FaultRST}}$
Floating	Not allowed	X ⁽¹⁾	X	X	X
To ground	Through 1 kΩ resistor	X	Not allowed	Through 15 kΩ resistor	Through 15 kΩ resistor

1. X: do not care.

2 Electrical specification

Figure 3. Current and voltage conventions

Note: $V_{Fn} = V_{OUTn} - V_{CC}$ during reverse battery condition.

2.1 Absolute maximum ratings

Stressing the device above the rating listed in Table 3. **Absolute maximum ratings** may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to the conditions in the table below for extended periods may affect the device reliability.

Table 3. Absolute maximum ratings

Symbol	Parameter	Value	Unit	
V_{CC}	DC supply voltage	36	V	
$-V_{CC}$	Reverse DC supply voltage	16	V	
V_{CCJS}	Maximum jump start voltage for single pulse short circuit protection	28	V	
$-I_{GND}$	DC reverse ground pin current	200	mA	
I_{OUT}	OUTPUT ₀ DC output current	Internally limited	A	
$-I_{OUT}$	Reverse DC output current	13	A	
I_{IN}	INPUT ₀ DC input current	-1 to 10	mA	
I_{SEn}	SEn DC input current	-1 to 3	mA	
I_{FR}	FaultRST DC input current	-1 to 10	mA	
I_{SENSE}	CS pin DC output current ($V_{GND} = V_{CC}$ and $V_{SENSE} < 0$ V)	10	mA	
	CS pin DC output current in reverse ($V_{CC} < 0$ V)	-20		
E_{MAX}	Maximum switching energy single pulse ($T_{Jstart} = 150$ °C)	25	mJ	
V_{ESD}	Electrostatic discharge (JEDEC 22A-114F)	INPUT ₀	2000	V
		CS	2000	
		SEn, FaultRST	2000	
		OUTPUT ₀	4000	
		V_{CC}	4000	
	Charge device model (CDM-AEC-Q100-011)	750		
T_J	Operating junction temperature range	-40 to 150	°C	
T_{stg}	Storage temperature range	-55 to 150	°C	

2.2 Thermal data

Table 4. Thermal data

Symbol	Parameter	Typ. value	Unit
R_{thJB}	Thermal resistance, junction-to-board (JEDEC JESD 51-8) ⁽¹⁾	6.9	°C/W
R_{thJA}	Thermal resistance, junction-to-ambient (JEDEC JESD 51-2) ⁽²⁾	53.3	°C/W
	Thermal resistance, junction-to-ambient (JEDEC JESD 51-2) ⁽¹⁾	21.8	

1. Device mounted on four-layers 2s2p PCB.

2. Device mounted on two-layers 2s0p PCB with 2 cm² heatsink copper trace.

2.3 Main electrical characteristics

7 V < V_{CC} < 28 V; -40 °C < T_J < 150 °C, unless otherwise specified.

All typical values refer to $V_{CC} = 13$ V; $T_J = 25$ °C, unless otherwise specified.

Table 5. Power section

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
V_{CC}	Operating supply voltage		4	13	28	V
V_{USD}	Undervoltage shutdown			2.1	2.7	V
$V_{USDReset}$	Undervoltage shutdown reset				4.5	V
$V_{USDhyst}$	Undervoltage shutdown hysteresis			0.15		V
R_{ON}	On-state resistance	$I_{OUT} = 4.75$ A; $T_J = 25$ °C		12		mΩ
		$I_{OUT} = 4.75$ A; $T_J = 150$ °C			26.4	
		$I_{OUT} = 4.75$ A; $V_{CC} = 4$ V; $T_J = 25$ °C			20.4	
		$I_{OUT} = 1$ A; $V_{CC} = 2.7$ V; V_{CC} decreasing			72	
R_{ON_Rev}	$R_{DS(ON)}$ in reverse battery condition	$V_{CC} = -13$ V; $I_{OUT} = -4.75$ A; $T_J = 25$ °C		12		mΩ
V_{clamp}	Clamp voltage	$I_S = 20$ mA; 25 °C < T_J < 150 °C	36	38	45	V
		$I_S = 20$ mA; $T_J = -40$ °C	36			
I_{STBY}	Supply current in standby at $V_{CC} = 13$ V ⁽¹⁾	$V_{CC} = 13$ V; $T_J = 25$ °C; $V_{IN} = V_{OUT} = V_{FR} = V_{SEn} = 0$ V;			0.5	μA
		$V_{CC} = 13$ V; $T_J = 85$ °C ⁽²⁾ $V_{IN} = V_{OUT} = V_{FR} = V_{SEn} = 0$ V;			0.5	
		$V_{CC} = 13$ V; $T_J = 125$ °C $V_{IN} = V_{OUT} = V_{FR} = V_{SEn} = 0$ V;			3	
t_{D_STBY}	Standby mode blanking time	$V_{CC} = 13$ V; $V_{IN} = V_{OUT} = V_{FR} = 0$ V; $V_{SEn} = 5$ V to 0 V	60	260	550	μs
$I_{S(ON)}$	Supply current at $V_{CC} = 13$ V	$V_{CC} = 13$ V; $V_{SEn} = V_{FR} = 0$ V; $V_{IN0} = 5$ V; $I_{OUT0} = 0$ A		1.6	2.5	mA
$I_{GND(ON)}$	Control stage current consumption in ON-state. All channels active.	$V_{CC} = 13$ V; $V_{SEn} = 5$ V; $V_{FR} = 0$ V; $V_{IN0} = 5$ V; $I_{OUT0} = 4.75$ A			3	mA
$I_{L(off)}$	Off-state output current at $V_{CC} = 13$ V ⁽¹⁾	$V_{IN} = V_{OUT} = 0$ V; $V_{CC} = 13$ V; $T_J = 25$ °C	0	0.01	0.5	μA

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
$I_{L(off)}$	Off-state output current at $V_{CC} = 13\text{ V}^{(1)}$	$V_{IN} = V_{OUT} = 0\text{ V}$; $V_{CC} = 13\text{ V}$; $T_J = 125\text{ °C}$	0		3	μA
V_F	Output - V_{CC} diode voltage at $T_J = 150\text{ °C}$	$I_{OUT} = -4.75\text{ A}$; $T_J = 150\text{ °C}$			0.7	V

1. Power MOSFET leakage included.
2. Parameter specified by design, not tested in production.

Table 6. Switching

$V_{CC} = 13\text{ V}$; $-40\text{ °C} < T_J < 150\text{ °C}$, unless otherwise specified						
Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
$t_{d(on)}^{(1)}$	Turn-on delay time at $T_J = 25\text{ °C}$	$R_L = 2.8\ \Omega$	10	50	120	μs
$t_{d(off)}^{(1)}$	Turn-off delay time at $T_J = 25\text{ °C}$		10	25	100	
$(dV_{OUT}/dt)_{on}^{(1)}$	Turn-on voltage slope at $T_J = 25\text{ °C}$	$R_L = 2.8\ \Omega$	0.2	0.45	0.7	V/ μs
$(dV_{OUT}/dt)_{off}^{(1)}$	Turn-off voltage slope at $T_J = 25\text{ °C}$	$R_L = 2.8\ \Omega$	0.2	0.5	0.7	
W_{ON}	Switching energy losses at turn-on (t_{won})	$R_L = 2.8\ \Omega$		0.5	1.9 ⁽²⁾	mJ
W_{OFF}	Switching energy losses at turn-off (t_{woff})	$R_L = 2.8\ \Omega$		0.4	1 ⁽²⁾	
$t_{SKEW}^{(1)}$	Differential Pulse skew ($t_{PHL} - t_{PLH}$)	$R_L = 2.8\ \Omega$	-77	-27	23	μs

1. See Figure 4. Switching time and pulse skew.
2. Parameter specified by design and evaluated by characterization, not tested in production.

Table 7. Logic inputs

$7\text{ V} < V_{CC} < 28\text{ V}$; $-40\text{ °C} < T_J < 150\text{ °C}$

3 Protections

3.1 Power limitation

The basic working principle of this protection consists of an indirect measurement of the junction temperature swing ΔT_J through the direct measurement of the spatial temperature gradient on the device surface in order to automatically shut off the output MOSFET as soon as ΔT_J exceeds the safety level of ΔT_{J_SD} . According to the voltage level on the $\overline{\text{FaultRST}}$ pin, the output MOSFET switches on and cycles with a thermal hysteresis according to the maximum instantaneous power which can be handled ($\overline{\text{FaultRST}} = \text{Low}$) or remain off ($\overline{\text{FaultRST}} = \text{High}$). The protection prevents fast thermal transient effects and, consequently, reduces thermo-mechanical fatigue.

3.2 Thermal shutdown

In case the junction temperature of the device exceeds the maximum allowed threshold (typically 175 °C), it automatically switches off and the diagnostic indication is triggered. According to the voltage level on the $\overline{\text{FaultRST}}$ pin, the device switches on again as soon as its junction temperature drops to T_R ($\overline{\text{FaultRST}} = \text{Low}$) or remains off ($\overline{\text{FaultRST}} = \text{High}$).

3.3 Current limitation

The device is equipped with an output current limiter in order to protect the silicon as well as the other components of the system (for example bonding wires, wiring harness, connectors, loads, etc.) from excessive current flow. Consequently, in case of short-circuit, overload or during load power-up, the output current is clamped to a safety level, I_{LIMH} , by operating the output power MOSFET in the active region.

3.4 Negative voltage clamp

In case the device drives inductive load, the output voltage reaches a negative value during turn off. A negative voltage clamp structure limits the maximum negative voltage to a certain value, V_{DEMAG} , allowing the inductor energy to be dissipated without damaging the device.

4.1.1 Diode (DGND) in the ground line

A resistor (typ. $R_{GND} = 4.7 \text{ k}\Omega$) should be inserted in parallel to D_{GND} if the device drives an inductive load.

This small signal diode can be safely shared amongst several different HSDs. Also in this case, the presence of the ground network produces a shift ($\approx 600 \text{ mV}$) in the input threshold and in the status output values if the microprocessor ground is not common to the device ground. This shift does not vary if more than one HSD shares the same diode/resistor network.

4.2 Immunity against transient electrical disturbances

The immunity of the device against transient electrical emissions, conducted along the supply lines and injected into the V_{CC} pin, is tested in accordance with ISO7637-2:2011 (E) and ISO 16750-2:2010.

The related function performance status classification is shown in [Table 12. ISO 7637-2 - electrical transient conduction along supply line](#).

Test pulses are applied directly to DUT (device under test) both in ON and OFF-state and in accordance to ISO 7637-2:2011(E), chapter 4.

The DUT is intended as the current device only, with external components as shown in [Figure 34. M0-9 application schematic](#).

Status II is defined in ISO 7637-1 Function Performance Status Classification (FPSC) as follows: "The function does not perform as designed during the test but returns automatically to normal operation after the test".

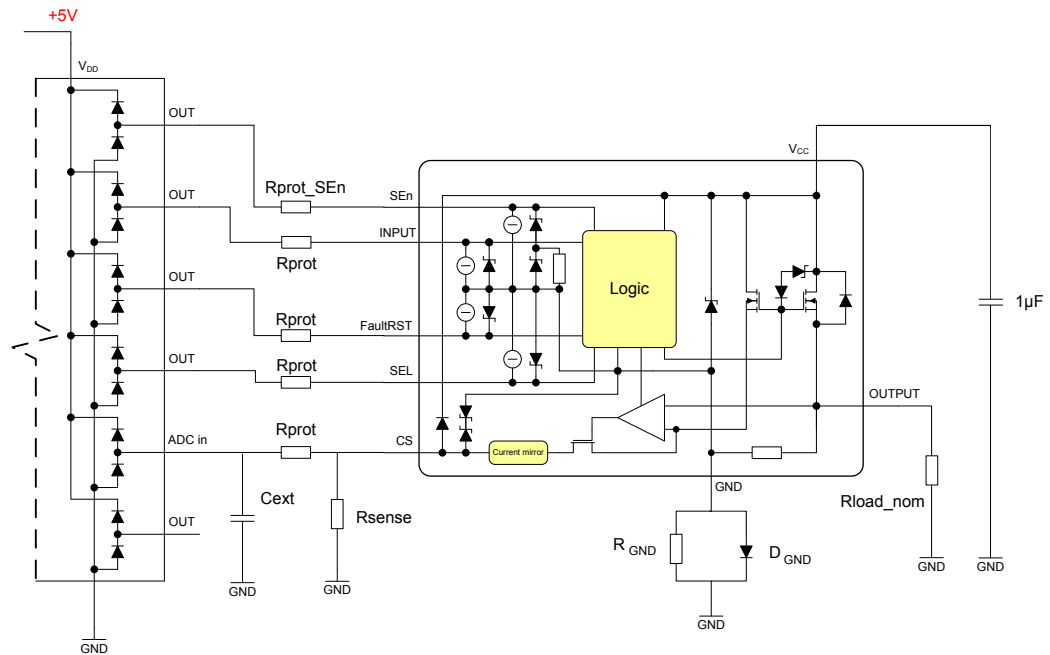

Table 12. ISO 7637-2 - electrical transient conduction along supply line

Test Pulse 2011(E)	Test pulse severity level with Status II functional performance status		Minimum number of pulses or test time	Burst cycle / pulse repetition time		Pulse duration and pulse generator internal impedance
	Level	U_S ⁽¹⁾		min	max	
1	III	-112 V	500 pulses	0.5 s		2 ms, 10 Ω
2a	III	+55 V	500 pulses	0.2 s	5 s	50 μs , 2 Ω
3a	IV	-220 V	1h	90 ms	100 ms	0.1 μs , 50 Ω
3b	IV	+150 V	1h	90 ms	100 ms	0.1 μs , 50 Ω
4 ⁽²⁾	IV	-7 V	1 pulse			100 ms, 0.01 Ω
Load dump according to ISO 16750-2:2010						
Test B ⁽³⁾		35 V	5 pulse	1 min		400 ms, 2 Ω

1. U_S is the peak amplitude as defined for each test pulse in ISO 7637-2:2011(E), chapter 5.6.

2. Test pulse from ISO 7637-2:2004(E).

3. With 35 V external suppressor referred to ground ($-40^\circ\text{C} < T_j < 150^\circ\text{C}$).

Figure 34. M0-9 application schematic

4.3 MCU I/Os protection

If a ground protection network is used and negative transients are present on the V_{CC} line, the control pins will be pulled negative. ST suggests to insert a resistor (R_{prot}) in line both to prevent the microcontroller I/O pins from latching-up and to protect the HSD inputs.

The value of these resistors is a compromise between the leakage current of microcontroller and the current required by the HSD I/Os (Input levels compatibility) with the latch-up limit of microcontroller I/Os.

Equation

$$\frac{V_{CCpeak}}{I_{latchup}} \leq R_{prot} \leq \frac{(V_{OH\mu C} - V_{IH} - V_{GND})}{I_{IHmax}} \quad (1)$$

Calculation example:

For $V_{CCpeak} = -150 \text{ V}$; $I_{latchup} \geq 20 \text{ mA}$; $V_{OH\mu C} \geq 4.5 \text{ V}$

$7.5 \text{ k}\Omega \leq R_{prot} \leq 140 \text{ k}\Omega$.

Recommended values: $R_{prot} = 15 \text{ k}\Omega$

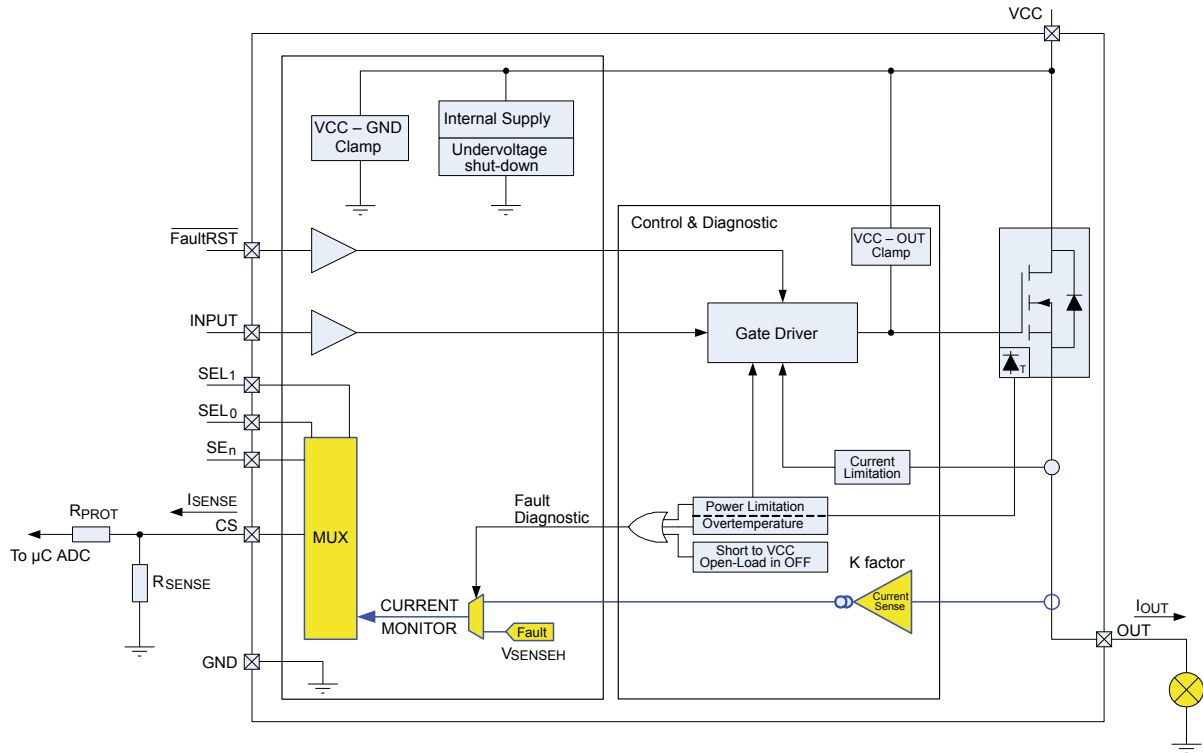

4.4 CS - analog current sense

Diagnostic information on device and load status are provided by an analog output pin (CS) delivering the following signals:

- Current monitor: current mirror of channel output current

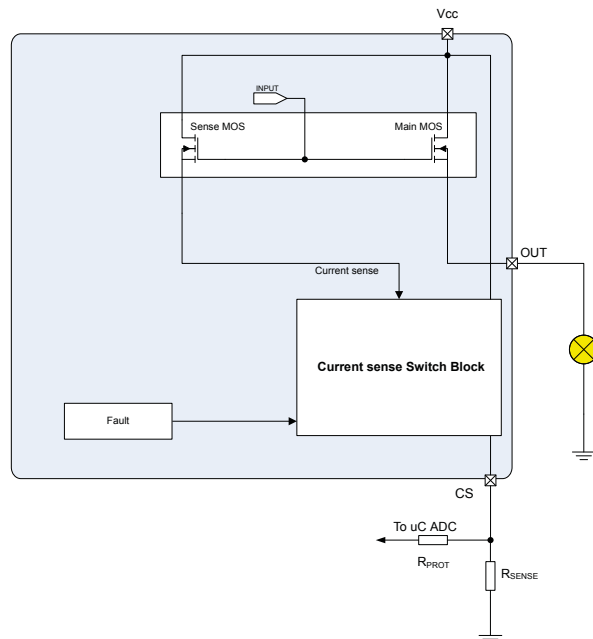

Those signals are routed through an analog multiplexer which is configured and controlled by means of SELx and SEn pins, according to the address map in [Table 11. Current sense multiplexer addressing](#).

Figure 35. Current Sense and diagnostic – block diagram

4.4.1 Principle of current sense signal generation

Figure 36. Current sense block diagram

Current sense

The output is capable of providing:

- Current mirror proportional to the load current in normal operation, delivering current proportional to the load according to a known ratio named K
- Diagnostics flag in fault conditions delivering fixed voltage V_{SENSEH}

The current delivered by the current sense circuit, I_{SENSE} , can be easily converted to a voltage V_{SENSE} by using an external sense resistor, R_{SENSE} , allowing continuous load monitoring and abnormal condition detection.

Normal operation (channel ON, no fault, SEn active)

While the device is operating in normal conditions (no fault intervention), V_{SENSE} calculation can be done using simple equations.

Current provided by MultiSense output: $I_{SENSE} = I_{OUT}/K$

Voltage on R_{SENSE} : $V_{SENSE} = R_{SENSE} \cdot I_{SENSE} = R_{SENSE} \cdot I_{OUT}/K$

Where:

- V_{SENSE} is the voltage measurable on the R_{SENSE} resistor
- I_{SENSE} is the current provided from CurrentSense pin in current output mode
- I_{OUT} is the current flowing through output
- K factor represents the ratio between PowerMOS cells and SenseMOS cells; its spread includes geometric factor spread, current sense amplifier offset and process parameters spread of overall circuitry specifying ratio between I_{OUT} and I_{SENSE} .

Failure flag indication

In case of power limitation/overtemperature, the fault is indicated by the CurrentSense pin, which is switched to a "current limited" voltage source, V_{SENSEH} .

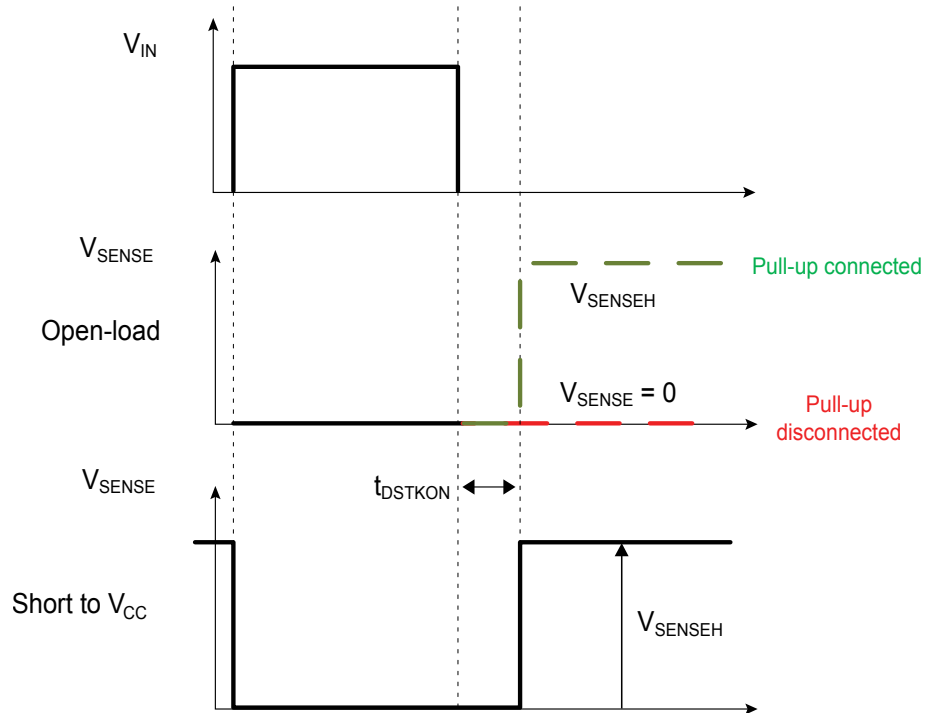

In any case, the current sourced by the CurrentSense in this condition is limited to I_{SENSEH} .

The typical behavior in case of overload or hard short-circuit is shown in Waveforms.

Figure 37. Analog HSD – open-load detection in off-state

GAPG1201151432CFT

Figure 38. Open-load / short to V_{CC} condition

Table 13. CS pin levels in off-state

Condition	Output	CS	SEn
Open-load	$V_{OUT} > V_{OL}$	Hi-Z	L
		V_{SENSEH}	H
Open-load	$V_{OUT} < V_{OL}$	Hi-Z	L
		0	H
Short to V _{CC}	$V_{OUT} > V_{OL}$	Hi-Z	L
		V_{SENSEH}	H
Nominal	$V_{OUT} < V_{OL}$	Hi-Z	L
		0	H

4.4.2 Short to V_{CC} and OFF-state open-load detection

Short to V_{CC}

A short circuit between V_{CC} and output is indicated by the relevant current sense pin set to V_{SENSEH} during the device off-state. Small or no current is delivered by the current sense during the on-state depending on the nature of the short-circuit.

OFF-state open-load with external circuitry

Detection of an open-load in off mode requires an external pull-up resistor R_{PU} connecting the output to a positive supply voltage V_{PU} .

It is preferable that V_{PU} is switched off during the module standby mode in order to avoid the overall standby current consumption to increase in normal conditions, i.e. when load is connected.

R_{PU} must be selected in order to ensure $V_{OUT} > V_{OLmax}$ in accordance with the following equation:

$$R_{PU} < \frac{V_{PU} - 4}{I_{L(off2)min@ 4V}} \quad (2)$$

5 Maximum demagnetization energy ($V_{CC} = 16\text{ V}$)
