4-Bit Shifter With 3-State Outputs  
*Product Specification*

### Logic Products

#### FEATURES

- Shifts 4 bits of data to 0, 1, 2, 3 places under control of two select lines
- 3-State outputs for bus organized systems
- Alternate source AM25S10

#### DESCRIPTION

The '350 is a combination logic circuit that shifts a 4-bit word from 0 to 3 places. No clocking is required as with shift registers.

The '350 can be used to shift any number of bits any number of places up or down by suitable interconnection. Shifting can be:

1. Logical – with logic zeros filled in at either end of the shifting field.
2. Arithmetic – where the sign bit is extended during a shift down.
3. End around – where the data word forms a continuous loop.

#### NOTE:

For information regarding devices processed to Military Specifications, see the Signetics Military Products Data Manual.

#### INPUT AND OUTPUT LOADING AND FAN-OUT TABLE

| PINS | DESCRIPTION | 74S   |
|------|-------------|-------|
| All  | Inputs      | 1Sul  |
| All  | Outputs     | 10Sul |

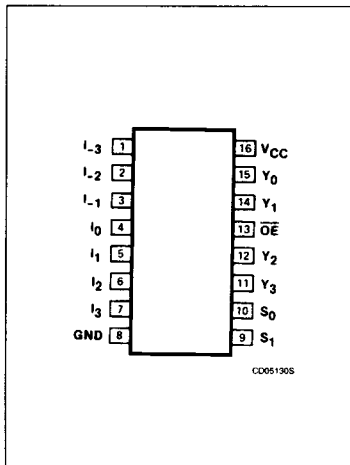

#### NOTE:

A 74S unit load (Sul) is  $50\mu A I_{IH}$  and  $-2.0mA I_{IL}$ .

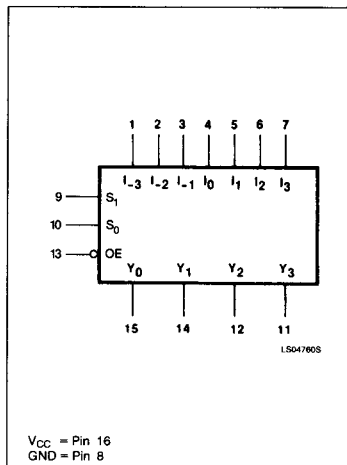

The 3-State outputs are useful for bus interface applications or expansion to a larger number of shift positions in end around shifting. The active LOW Output Enable ( $\overline{OE}$ ) input controls the state of

the outputs. The outputs are in the HIGH impedance "off" state when  $\overline{OE}$  is HIGH, and they are active when  $\overline{OE}$  is LOW.

## NOTES:

- For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable type.
- All typical values are at  $V_{CC} = 5V, T_A = 25^\circ\text{C}$ .
- $I_{OS}$  is tested with  $V_{OUT} = +0.5V$  and  $V_{CC} = V_{CC} \text{ MAX} + 0.5V$ . Not more than one output should be shorted at a time and duration of the short circuit should not exceed one second.

AC ELECTRICAL CHARACTERISTICS  $T_A = 25^\circ\text{C}, V_{CC} = 5.0V$
